

OPERATIONAL DESCRIPTION:

In phone mode position, to start playback recorder disc of the PCM data are transfer to the IC201 of the pre-amplifier and then it will pass to IC401 when receiving the audio data, the IC401 stores the first audio packet, which contained 1-Ms audio data, into the internal storage buffer. The IC401 starts playing the audio data to the USB device output then connects with the USB cable to through the computer of the USB enhanced host. After the operating system must be working on the host PC.

The audio signal will pass through to the frequency modulation transmission (FM TX 88.1, 89.9 MHz). The frequency channel is selected by slide switch. The FM signal will pass to the capacitor and transmit by the antenna.
