> Question #1: The test report indicates that this device uses 12V Car battery only, so power line conducted emission test data is not included. However, it becomes a PC peripheral just because it can be connected to a PC via a USB cable. Please verify if the device can be powered from USB port of PC. If it does, please add power line conducted emission test data into the report.

>

> Question #2: The block diagram indicates that CPU speed is 200MHz, in that case, radiated emission test must be done upto 2000MHz. The report indicates only radiated emission from 30MHz to 1GHz was investigated.

Please retest and update the test report.

>

> Question #3: Please revise FCC ID label format to remove a space between "S7T" and "VDG3000".
