***EUT Description:***

The Wireless Physiological Monitoring System is a wireless device designed to be used in place of standard cable. The system communication operates using frequency bands designed for use by the Wireless Medical Telemetry Service.

The system utilized RFID link process, which operates at 127 - 142 kHz frequency band.

Date of Test: September 2 to 8, 2005

**FCC ID: S8IWPMS**

## **2.2 Related Submittal(s) Grants**

This report is for use with an application for certification as a composite device, and subject to an additional equipment authorization. Two transmitters are included in the report. This specific report details the emission characteristics of transmitters.

## **2.3 Test Methodology**

Both AC mains line-conducted and radiated emission measurements were performed according to the procedures in ANSI C63.4 (2003). Radiated emission measurements were performed in 10 m Open Area Test Site. All Radiated tests were performed at an antenna to EUT distance of 3 meters, unless stated otherwise in the "**Justification Section**" of this Application.

## **2.4 Test Facility**

The test facility was a specially designed and constructed Open Area Test Site (OATS). Test site included a metal ground plane constructed of 22-gauge sheet metal. It contained a 2.5 meter diameter turntable for floor standing equipment, and a fiber glass table measuring 1.5 x 1.5 x 0.8 meters for table top equipment. To facilitate testing, also it has heat and air conditioning systems to control environmental test conditions.

This test facility and site measurement data have been fully placed on file with the FCC, Industry of Canada and A2LA accredited.

Test Facility: Intertek ETL Semko  
27611 La Paz Road, Suite C  
Laguna Niguel, CA 92677

### Accreditations:

FCC Registration Number: 90711  
A2LA Certificate Number: 2085-01  
IC Reference Number: IC 3753

Date of Test: September 2 to 8, 2005

**FCC ID: S8IWPMS****3.0 System Test Configuration****3.1 Justification**

For emission testing, the equipment under test (EUT) was configured for testing in a typical fashion (as a customer would normally use it). During testing, all cables were manipulated to produce worst case emissions.

For the measurements, the EUT is attached to a cardboard box (if necessary) and placed on the wooden turntable. If the EUT attaches to peripherals, they are connected and operational (as typical as possible). The EUT is wired to transmit full power.

The signal is maximized through rotation and placement in the three orthogonal axes. The antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters.

Radiated emissions are taken at three meters unless the signal level is too low for measurement at that distance. If necessary, a pre-amplifier is used and/or the test is conducted at a closer distance. All readings are extrapolated back to the equivalent three meter reading using inverse scaling with distance.

**3.2 EUT Exercising Software**

No software was required to exercise the EUT.

**3.3 System Test Configuration****3.3.1 Support Equipment**

### 3.4 Equipment Modification

None

### 3.5 Mode(s) of operation

The X Unit was powered from the battery. This component transmits the transducer signal via radiofrequency to the M unit. The EUT utilizes Frequency Shift Keyed (FSK) modulation in normal operation. During the tests EUT was wired to operate at continuous transmitting mode (CW).

The M Unit was powered from 9 VDC power adapter. This component connects to the patient monitor via IBP connection and receives the radiofrequency data transmission from X Unit. The EUT utilizes Frequency Shift Keyed (FSK) modulation in normal operation. During the tests EUT was wired to operate at continuous transmitting mode (CW).

NOTE:

Both units are transceivers utilizing the same transmitters in operation frequency range, and RFID reader system. The difference is only in control circuits.

Date of Test: September 2 to 8, 2005

**FCC ID: S8IWPMS**

## 4.0 Field Strength of Emission

### 4.1 Test Description

Parameter:	FCC 95.1115(a)(2) & (b)(2)
Requirement:	FCC 95.1115(a)(2) & (b)(2)
Fundamental: 1395 – 1400 MHz	Limit 117.4 dB $\mu$ V
Harmonics: above 960 MHz	Limit 54 dB $\mu$ V
Distance:	3 m

#### 4.1.1 Test Procedure

For the measurements, the EUT is attached to a cardboard box (if necessary) and placed on the wooden turntable which is 0.8 m above the ground plane on the open test site. If the EUT attaches to peripherals, they are connected and operational (as typical as possible). The EUT is wired to transmit full power in CW mode. Average Factor was calculated and added to the peak emission obtained in CW mode. The signal is maximized through rotation and placement in the three orthogonal axes. The antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters. Radiated emissions are taken at three meters unless the signal level is too low for measurement at that distance. If necessary, a pre-amplifier is used and/or the test is conducted at a closer distance. All readings are extrapolated back to the equivalent three meter reading using inverse scaling with distance. Radiated emission measurements were performed from 30 MHz to the 10<sup>th</sup> harmonic of transmitter frequency. Analyzer resolution is 120 KHz for 30 to 1000 MHz, 1 MHz for >1000 MHz. This test was performed per test procedure specified in ANSI C63.4 (2003).

#### 4.1.2 Field Strength Calculation

The field strength is calculated by adding the reading on the Spectrum Analyzer to the factors associated with antennas, cables, preamplifiers (if any) and average factors (when specified limits is in average and measurements are made with peak detectors) The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG + AV$$

where FS = Field Strength in dB( $\mu$ V/m)

RA = Receiver Amplitude in dB( $\mu$ V)

CF = Cable Attenuation Factor in dB

AF = Antenna Factor in dB/m

AG = Amplifier Gain in dB

AV = Average Factor in (-dB)

Assume a receiver reading of 52.0 dB( $\mu$ V) is obtained. The antenna factor of 7.4 dB/m ,cable factor of 4.6 dB and average factor of -5.1dB are added. The amplifier gain of 27 dB is subtracted, giving a field strength of 32 dB( $\mu$ V/m).

$$RA = 52 \text{ dB}(\mu\text{V}) \quad CF = 1.6 \text{ dB} \quad AV = -5.1 \text{ dB}$$

$$AF = 7.4 \text{ dB/m} \quad AG = 29 \text{ dB} \quad FS = 52 + 7.4 + 4.6 - 27 - 5.1 = 32 \text{ dB}(\mu\text{V/m})$$

---

Date of Test: September 2 to 8, 2005

FCC ID: S8IWPMS

This value in dB( $\mu$ V/m) was converted to its corresponding level in  $\mu$ V/m.

Level in  $\mu$ V/m = Common Antilogarithm  $\{[32 \text{ dB}(\mu\text{V}/\text{m})]/20\} = 39.8 \mu\text{V}/\text{m}$

**Note:** In the following table(s), the level shown on the data table includes the antenna factor, cable factor and preamplifier gain.

#### 4.1.3 Calculation of Average Factor.

Average Factor (AV) in dB =  $20 \log (\text{duty cycle})$

The specification for output field strength for frequencies above 1000 MHz according to FCC rules specify measurements with average detectors. The EUT use Frequency Shift Keyed (FSK) modulation in normal operation. During the tests EUT was wired to operate at continuous transmitting mode (CW). For field strength measurements of emission from transmitter, average factor was calculated and added to the peak emission obtained in CW mode and compared to the limit specified for average detector.

The time period over the duty cycle is measured is 100 milliseconds, or the repetition cycle, whichever is a shorter time frame. The worst case (highest percentage on) duty cycle is used for calculation.

The duty cycle is simply the On-time divided by the period:

Time period = 25 ms

Effective period of the cycle =  $1.625 \text{ ms} \times 2 = 3.25 \text{ ms}$

DC =  $3.25 \text{ ms}/25 \text{ ms} = 0.13$

AV =  $20 \log 0.13 = -17.7 \text{ dB}$

Plot on the next page shows the transmission timing over 25 ms time frame.

14276.250	1.0	53.5	53.4	9.5	54.0	-10.0

**Notes:**

- a) The field strength shown in the table (Vertical and Horizontal levels) included Antenna factor, Cable loss, Average factor (-17.7) and Pre-amplifier Gain (if applicable).
- b) Negative signs (-) in Margin column signify levels below the limits.
- c) For frequencies below 1000 MHz the, above limits are based on quasi-peak limits.  
Analyzer setting: RBW =120 KHz, VBW =300 KHz
- d) For frequencies above 1000 MHz the, above limits are based on average limits.
- e) Analyzer setting: RBW =1 MHz, VBW =1 MHz
- f) All other emissions not reported are below the equipment noise floor which is at least 10 dB below the limits.

Date of Test: September 2 to 8, 2005

**FCC ID: S8IWPMS**

g) D.C.F: Distance Correction Factor.

<b>Test Result</b>	<b>FCC 95.1115 (a)(2):</b> Passed with 39.0 dB margin at 1395.625 MHz. <b>FCC 95.1115 (b)(2):</b> Passed with 9.1 dB margin at 14276.25 MHz.

## 5.0 Out of Band Emission

### 5.1 Test Description

Parameter:	FCC 95.1115(b)
Requirement:	FCC 95.1115(b) & (b)(2)
below: 960 MHz	Limit 46 dB $\mu$ V
above: 960 MHz	Limit 54 dB $\mu$ V
Distance:	3 m

### 5.2 Test Procedure

See section 4.1.1.

### 5.3 Test Results

See attached plots.

The following plots show the relative spurious emission level of the X Unit in transmitting mode.

Plot #	Description
5.3.a	Plot shows peak scan emission from 30 to 1000 MHz. Plot shows emissions which verified below for compliance to section 95.1115(b)
5.3.b	Plot shows peak measurements differential between ch.1 fundamental and frequency range from 1000 to 1400 MHz. (78.4-40.8=37.6 dB $\mu$ V) < 54 dB $\mu$ V
5.3.c	Plot shows peak measurements differential between ch.1 fundamental and lower edge of the frequency band (78.4-37.1=41.3 dB $\mu$ V) < 54 dB $\mu$ V
5.3.d	Plot shows peak measurements differential between ch.1 fundamental and upper edge of the frequency band (78.4-39.1=39.3 dB $\mu$ V) < 54 dB $\mu$ V
5.3.e	Plot shows peak measurements differential between ch.4 fundamental and lower edge of the frequency band (78.3-46.7=31.6 dB $\mu$ V) < 54 dB $\mu$ V
5.3.f	Plot shows peak measurements differential between ch.4 fundamental and upper edge of the frequency band (78.3-39.1=39.2 dB $\mu$ V) < 54 dB $\mu$ V
5.3.g	Plot shows peak measurements differential between ch.5 fundamental and lower edge of the frequency band (76-39.5=36.5 dB $\mu$ V) < 54 dB $\mu$ V
5.3.h	Plot shows peak measurements differential between ch.5 fundamental and upper edge of the frequency band (76-39.7=36.3 dB $\mu$ V) < 54 dB $\mu$ V
5.3.i	Plot shows peak measurements differential between ch.6 fundamental and lower edge of the frequency band (75.9-38.3=38.8 dB $\mu$ V) < 54 dB $\mu$ V
5.3.j	Plot shows peak measurements differential between ch.6 fundamental and upper edge of the frequency band (75.9-37.6=38.3 dB $\mu$ V) < 54 dB $\mu$ V
5.3.k	Plot shows peak measurements differential between ch.6 fundamental and frequency range from 1400 to 2000 MHz (75.9-42.5=33.4 dB $\mu$ V) < 54 dB $\mu$ V

Date of Test: September 2 to 8, 2005

**FCC ID: S8IWPMS**

5.3.l	Plot shows no spurious emission from 2000 to 4000 MHz.
5.3.m	Plot shows no spurious emission from 4000 to 6500 MHz.

**Note 1:** There are no emissions, except harmonics, observed above frequency 2000 MHz. All spurious emissions outside the frequency bands 1395 – 1400 and 1427 – 1431.5 MHz are attenuated below the limits in reference of level of fundamental.

**FCC ID: S8IWPMS****6.0 Antenna Requirement****6.1 Test description**

Parameter:	FCC 15.203
Requirement:	FCC 15.203
Descriptions:	No antenna other than furnished by the responsible party shall be used with the device.

**6.2 Test Procedure**

None

**6.3 Test Result**

The device is considered to comply with the requirements by:

	<b>Description</b>
X	The transmitter uses a permanently connected antennas.
	The antenna is affixed to the EUT using a unique connector which allows for replacement of a broken antenna, but does NOT use a standard antenna jack or electrical connector.

Date of Test: September 2 to 8, 2005

**FCC ID: S8IWPMS****7.0 Line Conducted Emission****7.1 Test Description**

Parameter:	FCC 15.107, 15.207	
Requirement:	FCC 15.107, class B; 15.207	
Frequency (MHz)	QP Limits (dB $\mu$ V)	AVG Limits (dB $\mu$ V)
0.15 to 0.50	66 to 56	56 to 46
0.50 to 5	56	46
5 to 30	60	50

**7.2 Test Procedure**

All conducted voltage measurements were made on each current-carrying conductor at the plug end of the EUT power cord or calibrated extension by the use of mating plugs and receptacles on the EUT and LISN/AMN if used. Equipment was tested with power cords that were normally used or that have electrical and shielding characteristics that were the same as those cords normally used. For those measurements using a LISN/AMN, the  $50\ \Omega$  measuring port was terminated by a  $50\ \Omega$  receiver or a  $50\ \Omega$  resistive load. Hence all  $50\ \Omega$  measuring ports of the LISN/AMN were terminated by  $50\ \Omega$ .

If a screened room or chamber was used, the EUT was placed 40 cm from a conductive wall, with the wall at the lead of the EUT. If the test was being performed on an OATS or sheltered site, the vertical ground plane was placed 40 cm away from the rear of the EUT.

The excess length of the lead between the EUT and the LISN/AMN receptacle (or mains outlet where a LISN/AMN cannot be used) was folded back and forth at the center of the lead to form a bundle not exceeding 40 cm in length. If the EUT does not have a flexible power lead, then it was placed at a distance of 80 cm from the LISN/AMN (or mains outlet where a LISN/AMN cannot be used) and connected to it by a lead or appropriate connection no longer than 1 m. Measurements were made at the LISN/AMN end of this lead or connection

Conducted emission measurements were performed according to the procedures in ANSI C63.4 (2003)

Date of Test: September 2 to 8, 2005

Frequency	AV	AV Limit	Q. Peak	QP Limit	Margin
MHz	(dB $\mu$ V)				
0.199	16.8	53.7	31.4	63.7	-32.3
0.6	25.7	46	29.7	56	-20.3
4.4	28.8	46	30.5	56	-17.2
13.1	26.4	50	37.7	60	-22.3
14.8	35.7	50	36.4	60	-14.3
15.5	34.7	50	35.3	60	-15.3

Measurements made on selected frequencies from line conductor are given below:

Frequency	AV	AV Limit	Q. Peak	QP Limit	Margin
MHz	(dB $\mu$ V)				
0.199	16.7	53.7	31.7	63.7	-32
0.6	25.6	46	30.2	56	-20.4
4.4	28.6	46	30.2	56	-17.4
13.1	36.3	50	37.5	60	-13.7
14.8	35.8	50	36.5	60	-14.2
15.5	34.8	50	35.5	60	-15.2

- Note 1: a) A complete scan from 0.15 - 30 MHz was made.  
b) Analyzer setting: RBW = 9 kHz, VBW = 30 kHz  
c) Detector mode: Quasi-peak and Average.  
d) All other measurements were more than 10 dB below the limit lines.  
e) Numbers with a minus sign in margin column are below the limit.

The next two pages are the peak scan made on line and neutral conductors

<b>Test Result</b>	<b>Passed with margin 13.7 dB at 13.1 MHz</b>
--------------------	---

Date of Test: September 2 to 8, 2005

**FCC ID: S8IWPMS****8.0 Occupied Bandwidth****8.1 Test description**

Requirement:	FCC §2.1049
Emission Bandwidth:	20 dB

**8.2 Test Procedure**

The measurement antenna was positioned at distance 3 m from the transmitter.  
Span = approximately 2 to 3 times of the 20 dB bandwidth, centered on the channel.  
RBW  $\geq$  1% of the 20 dB bandwidth.  
The bandwidth is measured at the 20 dB RF output.

**8.3 Test Results**

Please see next page for the occupied bandwidth plot:

Test Result:	The Occupied Bandwidth is 594 kHz

**FCC ID: S8IWPMS****9.0 Emission Types****9.1 Test Description**

Parameter:	FCC 95.1115(c)
Requirement:	FCC 95.1115(c)
Descriptions:	Any emission type is accepted except for video and voice. Waveforms such as electrocardiograms (ECGs) are not considered video. Operation may be under manual or automatic control, and on continuous basis.

**9.2 Test Procedure**

None

**9.3 Test Result**

The device is considered to comply with the requirements by:

	<b>Description</b>
X	This device transmits data only.

Date of Test: September 2 to 8, 2005

**FCC ID: S8IWPMS****10.0 Channel Use****10.1 Test Description**

Parameter:	FCC 95.1115(d)
Requirement:	FCC 95.1115(d)
Descriptions:	Within the 1395 -1400 MHz and 1427 – 1431.5 MHz WMTS device may operate on any channels – none are specified.

**10.2 Test Procedure**

None

**10.3 Test Result**

The device is considered to comply with the requirements by:

	<b>Description</b>
X	Avoids harmful interference to other WMTS devices. Channels use is shared and cannot be assigned exclusively use by any one entity.

Date of Test: September 2 to 8, 2005

**FCC ID: S8IWPMS**

## 11.0 Frequency Stability

### 11.1 Test description

Requirement:	FCC § 2.1055, § 95.1115(e)
Frequency Tolerance:	Within 0.004% (40ppm)

### 11.2 Test Procedure

The ppm frequency error of the transmitter was calculated by:

$$\text{ppm error} = \left( \frac{\text{MCF}}{\text{ACF}} - 1 \right) \cdot 10^6$$

Where MCF is the Measured Carrier Frequency in MHz  
ACF is the Assigned Carrier Frequency in MHz

#### 11.2.1 Frequency Stability vs. Temperature

For X Unit:

The equipment under the test was connected to an external DC power supply and the RF output was connected to a frequency counter via feedthrough attenuators. The EUT was placed inside the temperature chamber.

The temperature stability was measured with variation of ambient temperature as follows:

- From -30°C to +50°C with intervals of 10°C
- After the temperature stabilized for approximately 20 minutes, the frequency of the output signal was recorded from the counter.

#### 11.2.2 Frequency Stability vs. Voltage

For M Unit with AC power adapter:

At room temperature ( $25 \pm 5$  °C), an external variable AC power supply was connected to the EUT. The frequency of the transmitter was measured for 115%, 100% and 85% of the nominal operating input voltage.

For M Unit with 9 VDC power pack:

At room temperature ( $25 \pm 5$  °C), an external variable DC power supply was connected to the EUT. The frequency of the transmitter was measured for 9 VDC and 4 VDC.

For X Unit with 1.5 VDC battery:

At room temperature ( $25 \pm 5$  °C), an external variable DC power supply was connected to the EUT. The frequency of the transmitter was measured for 1.5 VDC and 1.0 VDC.

Date of Test: September 2 to 8, 2005

**FCC ID: S8IWPMS**
**11.3 Test Results**

X Unit:

Frequency Stability vs Temperature		
ACF (MHz):	1395.625	Limit: 40 ppm
Temperature, C	MCF (MHz)	PPM Error
50	1395.64083	11.34258845
40	1395.63922	10.18898343
30	1395.63813	9.407971339
20	1395.63783	9.193013883
10	1395.63662	8.326018809
0	1395.63489	7.086430811
-10	1395.63141	4.592924317
-20	1395.62655	1.110613524
-30	1395.616	-6.44872369

M Unit with AC adapter:

Frequency Stability vs Voltage		
ACF (MHz):	1395.625	Limit: 40 ppm
%	Voltage	MCF (MHz)
115	138.00	1395.626
100	120.00	1395.6264
85	102.00	1395.62618

M Unit with 9 VDC battery pack:

Frequency Stability vs Voltage		
ACF (MHz):	1395.625	Limit: 40 ppm
%	Voltage	MCF (MHz)
	9 VDC	1395.6264
	4 VDC	1395.6261

X Unit with 1.5 VDC battery:

Frequency Stability vs Voltage		
ACF (MHz):	1395.625	Limit: 40 ppm
%	Voltage	MCF (MHz)
	1.5 VDC	1395.63783
	1.0 VDC	1395.63745

Note: 40 ppm (60) kHz frequency change would not shift emission outside the band of operation and sideband emission would not exceed specified limits. See margins in section 5.0

Date of Test: September 2 to 8, 2005

**FCC ID: S8IWPMS****12.0 RF Safety****12.1 RF Exposure Evaluation**

Parameter:	FCC 95.1125
Requirement:	FCC 2.1093, 1.1307(b)(2)
Descriptions:	This "WMTS device can be classified as "Portable" and subject for routine environmental evaluation.

**12.1.1 Test Procedure**

None

**12.1.2 Test Result**

The device is considered to comply with the requirements by:

	<b>Description</b>
X	<i>Limit for general population:</i> No SAR evaluation is required for user distance < 2.5 cm: $P < 60/f(\text{GHz}) \text{ mW}$ $EIRP = E - 95.3 = 78.4 \text{ dB}\mu\text{V} - 95.3 = -16.9 \text{ dBm} \rightarrow 0.02 \text{ mW}$ $0.02 \text{ mW} < 60/1.4 = 42.8 \text{ mW}$
	<i>Conclusion:</i> No SAR evaluation is required.

Date of Test: September 2 to 8, 2005
