

## SCS KilnScout Transmitter Label

The KilnScout Transmitter is used inside a wood-drying kiln, where the temperature is high (125C) and chemicals from the environment form a coating on the product during normal use. Any external labels will be damaged and external engravings may become obscured by solid deposits.

The transmitter label will be printed on the KilnScout Transmitter enclosure under the battery door in two parts that are located side-by-side. The label will be visible when the door is removed to install or change batteries.
