產品名稱	(Product)	WiFi Low Power Module
解決方案	(Solution)	Nordic nRF7002 QFN Package
產品型號	(Model No.)	**AN7002Q – U** (u.FL Connector)
產品料號	(Part No.)	see *3.1 Order code*

Index

1. Overall introduction

Raytac's AN7002Q is a low power WiFi 6 module designed based on Nordic nRF7002 companion solution and it supports dual-band 2.4 GHz and 5 GHz band operation. The antenna ports are single-ended 50 Ω and it supports 20 MHz wide channels, 1x1 Single-Input Single-Output (SISO) operation and can deliver a PHY data rate of 86 Mbps (MCS7). AN7002Q series is a wireless module that adds low-power Wi-Fi 6 capabilities to another System on Chip (SoC), Microprocessor Unit (MPU), or Microcontroller Unit (MCU) host. AN7002Q is compatible with IEEE 802.11ax (also known as Wi-Fi 6) and with earlier standards IEEE 802.11 a/b/g/n/ac and which has been designed for IoT applications and is ideal for adding modern Wi-Fi 6 capabilities to existing Bluetooth® Low Energy, Thread®, or Zigbee® systems.

It connects to the host SoC or MCU through a Serial Peripheral Interface (SPI) or Quad Serial Peripheral Interface (QSPI) serial interface (which can optionally be encrypted) and supports coexistence with other radio protocols through a dedicated 3-wire or 4-wire coexistence interface.

It supports Station and Wi-Fi Direct operation modes as well as Software Enabled Access Point (Soft AP) (Wi-Fi 4 operation only) and simultaneous station + soft AP/Wi-Fi Direct/station modes.

1.1. Features

1. Wi-Fi® 6 companion IC with integrated RF.
2. Supports IEEE 802.11 ax and earlier standards (IEEE 802.11 a/b/g/n/ac)
3. Supports Target Wake Time (TWT), Orthogonal Frequency Division Multiple Access (OFDMA), Basic Service Set (BSS) Coloring
4. Supports Wi-Fi CERTIFIED 6™, Wi-Fi CERTIFIED™, Wi-Fi Enhanced Open™
5. Supports WPA3™, WPA2™, WPA™ - Personal and Enterprise, Protected Management Frames
6. Supports WMM®, WMM - Power Save, Wi-Fi Agile Multiband™, Wi-Fi Direct®
7. Dual-band 2.4 GHz and 5 GHz operation in 1x1 (SISO) operation.
8. 3-wire or 4-wire coexistence interface and compatible with Raytac MDBT53 series module.

1.2.   Application

・Internet of Things (IoT)

・Smart Home application

・Gateways and Border Routers

・Industrial IoT sensors and controllers

・Sports and Fitness sensor and monitor devices

・Wireless payment enabled devices

・Health monitor devices

・Wi-Fi locationing based on SSID scanning

1.3.   General parameters

Model name	AN7002Q-P	AN7002Q	AN7002Q-U
Dimension (L x W x H)	17.1 x 10.8 x 2.1 mm	17.1 x 10.8 x 2.1mm	16.4 x 10.8 x 2.1mm
Weight (g)	0.78 (±0.02g)	0.79 (±0.02g)	0.85 (±0.02g)
Interface	SPI or QSPI		
Supply voltage	2.9V to 4.5V		
Operating temperature	-40 to +85°C		
Support antenna	1 x 1 (SISO)		
RF channels	2.4G	Ch1-Ch14*	
	5G	Ch36/40/44/48/52/56/60/64 Ch100/104/108/112/116/120/124/128/132/136/140/144 Ch149/153/157/161/165/169/173/177	
IEEE WLAN Standard	IEEE 802.11 a/b/g/n/ac/ax		

Channel 14 is only available for use in Japan, and it only supports the IEEE 802.11b standard (DSSS modulation).

4.3. Electrical specifications

4.3.1. General characteristics

Symbol	Parameter	Min.	Nom.	Max.	Units	Note
$f_{OP,2.4GHz}$	Operating frequencies 2.4 GHz	2401		2495	MHz	
$f_{OP,5GHz}$	Operating frequencies 5 GHz	5170		5330	MHz	U-NII-1/U-NII-2A sub-bands
		5490		5730		U-NII-2C sub-band
		5735		5895		U-NII-3/U-NII-4 sub-bands
$f_{MOD,MIN}$	Minimum modulation rate		1DSSS			2.4 GHz
			6 Mbps			5 GHz
$f_{MOD,MAX}$	Maximum modulation rate		MCS7			
f_{TOL}	Crystal frequency tolerance at 25°C[1]			20	ppm	
$f_{STA,TEMP}$	Crystal frequency stability over temperature and aging			13	ppm	
C_{L_XO}	XO load capacitance		8		pF	
ESR_{XO}	Equivalent Series Resistance			100	ohm	
$t_{SHUTDOWN \rightarrow ACTIVE}$	Startup time from shutdown state		400		ms	Depends on patch size and interface speed
$t_{SLEEP \rightarrow ACTIVE}$	Startup time from sleep state		6.7		ms	

4.3.2. Electric current consumption

Symbol	Parameter	Min.	Nom.	Max.	Units	Note
$I_{RX,2.4GHz}$	Receive current listen (2.4 GHz)		60		mA	
$I_{RX,5GHz}$	Receive current listen (5 GHz)		56		mA	
$I_{2.4GHz,DTIM1}$	Average current consumption (2.4GHz,DTIM=1, beacon duration 3.8 ms)		3.47		mA	
$I_{2.4GHz,DTIM3}$	Average current consumption (2.4GHz,DTIM=3, beacon duration 3.8 ms)		1.12		mA	
$I_{2.4GHz,DTIM10}$	Average current consumption (2.4GHz,DTIM=10, beacon duration 3.8 ms)		0.34		mA	
$I_{5GHz,DTIM1}$	Average current consumption (5GHz,DTIM=1, beacon duration 0.7 ms)		1.70		mA	
$I_{5GHz,DTIM3}$	Average current consumption (5GHz,DTIM=3, beacon duration 0.7 ms)		0.56		mA	
$I_{5GHz,DTIM10}$	Average current consumption (5GHz,DTIM=10, beacon duration 0.7 ms)		0.19		mA	
$I_{2.4GHz,TWT,1\,min}$	Average current consumption (2.4GHz, TWT, target wake interval 1 min)[2]		29.5		uA	
$I_{2.4GHz,TWT,1\,hour}$	Average current consumption (2.4GHz, TWT, target wake interval 1 hour)[2]		18.4		uA	
$I_{2.4GHz,TWT,1\,day}$	Average current consumption (2.4GHz, TWT, target wake interval 1 day)[2]		18.2		uA	
$I_{5GHz,TWT,1\,min}$	Average current consumption (5GHz, TWT, target wake interval 1 min)[2]		28.9		uA	
$I_{5GHz,TWT,1\,hour}$	Average current consumption (5GHz, TWT, target wake interval 1 hour)[2]		18.2		uA	
$I_{5GHz,TWT,1\,day}$	Average current consumption (5GHz, TWT, target wake interval 1 day)[2]		18.0		uA	
I_{OFF}	Shutdown current		1.7		µA	
I_{SLEEP}	Sleep current (with RTC)		15		µA	
I_{SCAN}	Average current consumption during scan operation		60		mA	The exact current depends on the number of Aps detected during scan. The value quoted aligns with ~100 APs.

[2] Min wake duration 8.192 ms, transmit packet duration 100 µs.

4.3.3. Receiver characteristics

Symbol	Parameter	Min.	Nom.	Max.	Units	Note
$P_{SENS,2.4GHz,1DSSS}$	Sensitivity 2.4GHz (1 Mbps DSSS)		-98.6		dBm	
$P_{SENS,2.4GHz,11CCK}$	Sensitivity 2.4GHz (11 Mbps CCK)		-90.4		dBm	
$P_{SENS,2.4GHz,6MBPS}$	Sensitivity 2.4GHz (6 Mbps)		-91.6		dBm	
$P_{SENS,2.4GHz,54MBPS}$	Sensitivity 2.4GHz (54 Mbps)		-75.4		dBm	
$P_{SENS,2.4GHz,HT-MCS0}$	Sensitivity 2.4GHz (HT-MCS0)		-90.0		dBm	
$P_{SENS,2.4GHz,HT-MCS7}$	Sensitivity 2.4GHz (HT-MCS7)		-71.5		dBm	
$P_{SENS,5GHz,VHT-MCS0}$	Sensitivity 5.0GHz (VHT-MCS0)		-89.3		dBm	
$P_{SENS,5GHz,VHT-MCS7}$	Sensitivity 5.0GHz (VHT-MCS7)		-71.0		dBm	
$P_{SENS,5GHz,HE-MCS0}$	Sensitivity 5.0GHz (HE-MCS0)		-89.3		dBm	
$P_{SENS,5GHz,HE-MCS7}$	Sensitivity 5.0GHz (HE-MCS7)		-70.6		dBm	

4.3.4. Transmit current consumption

Symbol	Parameter	Min.	Nom.	Max.	Units	Note
$I_{TX,1DSSS,2.4GHz}$	Transmit current (2.4 GHz, 1DSSS, max output power)		252		mA	
$I_{TX,MSC0,2.4GHz}$	Transmit current (2.4 GHz, MSC0, max output power)		187		mA	
$I_{TX,MCS7,2.4GHz}$	Transmit current (2.4 GHz, MCS7, max output power)		191		mA	
$I_{TX,MSC0,5GHz}$	Transmit current (5 GHz, MSC0, max output power)		260		mA	
$I_{TX,MCS7,5GHz}$	Transmit current (5 GHz, MCS7, max output power)		260		mA	

4.3.5. Transmitter characteristics

Symbol	Parameter	Min.	Nom.	Max.	Units	Note
$P_{TXMAX,2.4GHz,DSSS//CCK}$	Maximum transmit power 2.4 GHz (DSSS/CCK)		20		dBm	
$P_{TXMAX,2.4GHz,MCS0}$	Maximum transmit power 2.4 GHz (6 Mbps/HT-MCS0/HE-MCS0)		15		dBm	
$P_{TXMAX,2.4GHz,MCS7}$	Maximum transmit power 2.4 GHz (54 Mbps/HT-MCS7/HE-MCS7)		15		dBm	
$P_{TXMAX,5GHz,MCS0}$	Maximum transmit power 5 GHz (6 Mbps/HT-MCS0/VHT-MCS0/HE-MCS0)		13		dBm	
$P_{TXMAX,5GHz,MCS7}$	Maximum transmit power 5 GHz (54 Mbps/HT-MCS7/VHT-MCS7/HE-MCS7)		13		dBm	

4.3.6. Transmitter power variation over temperature

Frequency band	-40C<TA<=-20C	-20C<TA<=0C	0C<TA<=60C	60C<TA<=85C
2.4GHz	0dB	0dB	0dB	-1dB
5GHz	-2dB	-1dB	0dB	-2dB

4.3.7. Transmitter power variation over supply voltage

Frequency band	2.9V<VBAT<=3.1V	3.1V<VBAT<=3.4V	3.4V<VBAT<=4.5V
2.4GHz	-1dB	0dB	0dB
5GHz	-2dB	-1dB	0dB

5. Block diagram
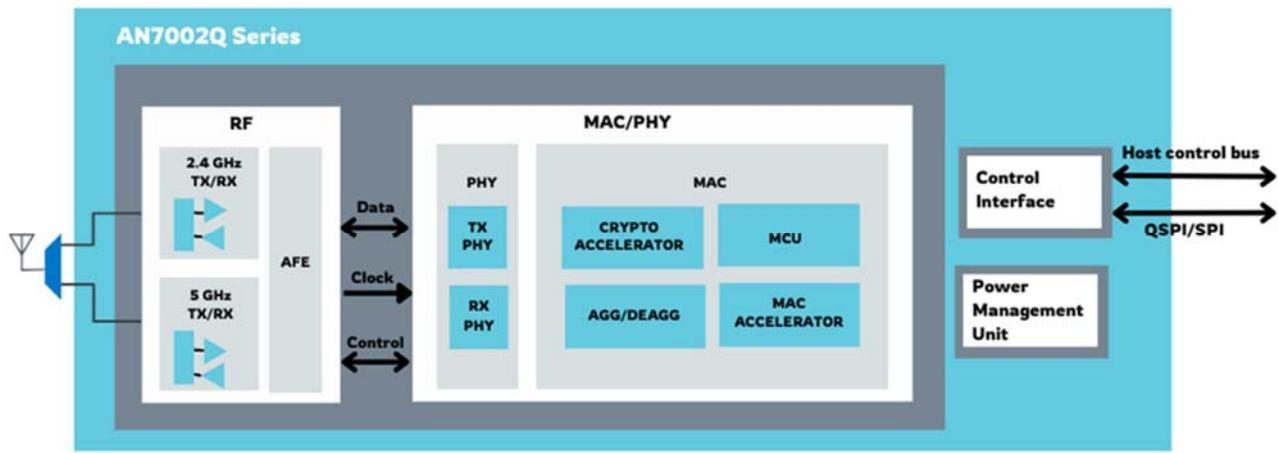

AN7002Q module
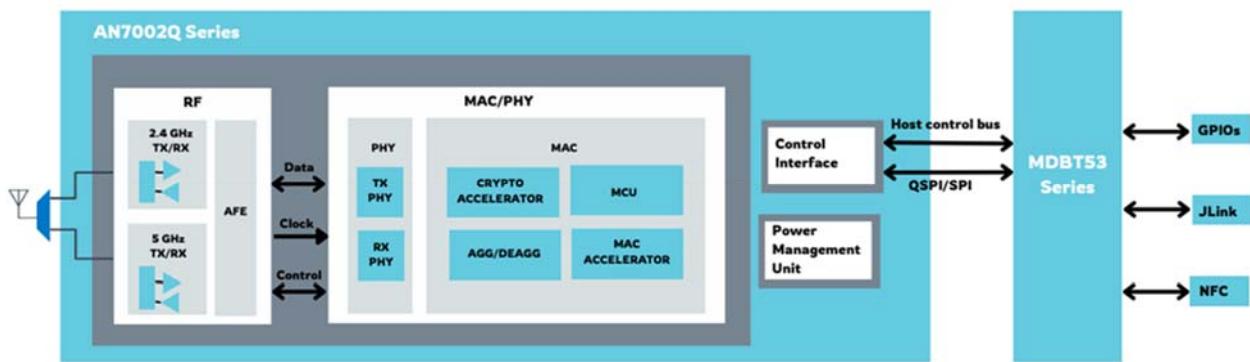

**AN7002Q module is a companion alongside MDBT53 module**

6. Host connection

AN7002Q is a wireless companion device that is connected to a host MCU or application processor. It is connected to the host through a QSPI (6-wire) or SPI (4-wire) for data and a 3-wire or 4-wire coexistence control interface for hosts that include a Bluetooth LE/IEEE 802.15.4 radio. In addition, two lines (HOST_IRQ and BUCKEN) are required. The user application executes on the host MCU.

The following figure shows a system with AN7002Q and a host MCU.

AN7002Q is designed to support radio coexistence and can be used together with another nRF Series device. The following figure shows AN7002Q together with Raytac MDBT53 series to achieve a combined Bluetooth LE and Wi-Fi solution. nRF5340 functions as a host and common interface to the wireless system.
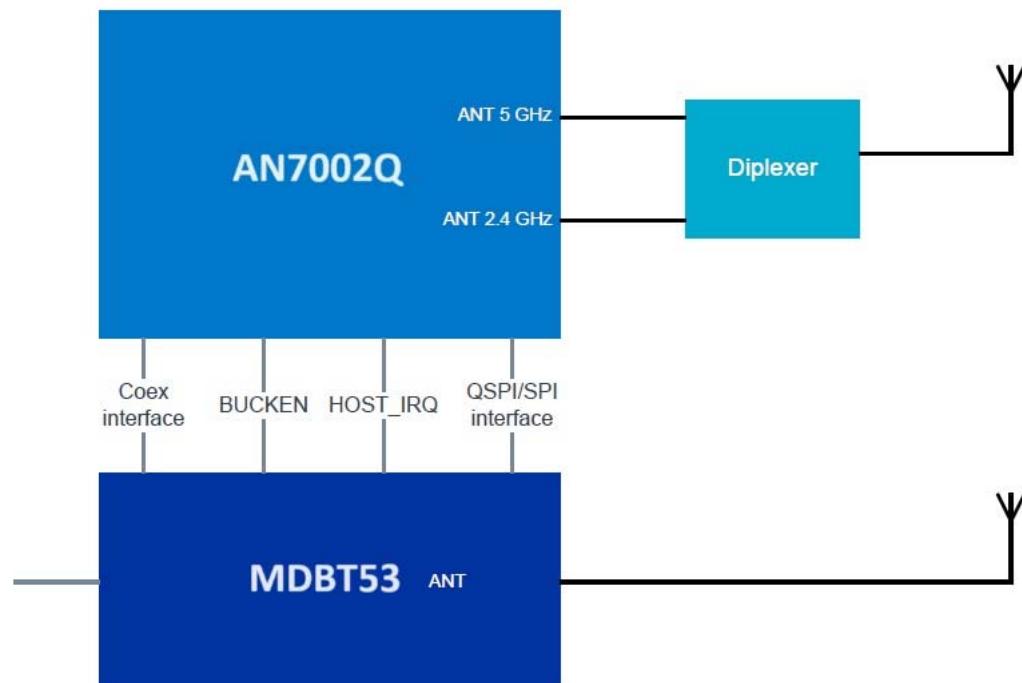

7. Power and clock management

The power and clock management system in AN7002Q is optimized for ultra-low power applications to ensure maximum power efficiency.

7.1. Power states

AN7002Q ==series== ==have== three power states: Shutdown, Sleep, and Active.

● **<u>Shutdown</u>**

A fully inactive state where no state information is retained except for the contents of the *One Time Programmable (OTP) memory*. AN7002Q will only respond to a BUCKEN assertion (input to *Power Management Unit (PMU)*).

The following conditions occur during Shutdown state:

- PMU: Off

- Analog circuits: All circuits off

- Baseband logic and scratch RAMs: Off

- Retention RAMs: Off

- *SPI/QSPI: Off*

● **<u>Sleep</u>**

A low-power state where state information is retained and transitioning to Active state can occur rapidly. The device may be in the Sleep state during both pre-association (device idle waiting for host command) and post-association period as part of the Wi-Fi Power Save mode (that is, maintain association with an Access Point but without data traffic). In this state, the device is clocked through the internal 32 kHz RC oscillator (Real-time Clock (RTC)), and can be awakened through the host interface or the internal sleep timer expiry.

The following conditions occur during Sleep state:

- PMU: Low-power mode (Pulse-Frequency Modulation (PFM))

- Analog circuits: RTC active, register state retained. All other circuits are powered down.

- Baseband logic and scratch RAMs: Off

- Retention RAMs: Off

- SPI/QSPI: On

- **Active**

In the Active state, the device will be in one of the Active sub-states: Transmit, Receive, or Idle. The high frequency crystal oscillator derived clocks are active and the appropriate RF section components are enabled as required. The Idle sub-state is a short term transitory state used when Receive is not required, but Sleep cannot be exploited (for example, upon early termination of an RX packet).

The following conditions occur during Active state:

- PMU: High-power mode *(Pulse-Width Modulation (PWM))*

- Analog circuits: All circuits powered (including crystal oscillator). The circuits are enabled according to Active sub-state (TX, RX, or IDLE)

- Baseband logic and scratch RAMs: On

- Retention RAMs: Active

- SPI/QSPI: On

7.2. Power state operation

Apart from transitions in or out of Shutdown state through the BUCKEN pin, all transitions between Sleep and Active states are automatic and do not rely on any control pin assertion or de-assertion.

Shutdown state is achieved by de-assertion on the BUCKEN pin. Asserting BUCKEN will result in the Active (IDLE sub-state) state being entered. The host will initiate the boot sequence through SPI/QSPI, culminating in the Sleep state being entered. This is the lowest power non-Shutdown state that can be achieved. Transitions from Active to Sleep are fully controlled by AN7002Q. Transitions from Sleep to Active are determined by both the host and AN7002Q. In a pre-association condition, Sleep is entered opportunistically whenever there is no activity initiated from the host (for example, a scan request). In a post-association condition, Sleep opportunities are determined by the negotiated Power Save mode of the Access Point. No host interactions are required to enter Sleep, while the host invokes a transition from Sleep to Active as part of any SPI/QSPI command transaction.

1. Switch the Power Management Unit (PMU) to high power mode (PWM).
2. Apply power to the digital logic, RAMs, and analog circuits.
3. Start the 40 MHz crystal oscillator and allow to settle.
4. Start the baseband PLL and allow to settle.

5. Boot all processor cores.

6. Execute baseband initializations.

7. Execute RF initializations and calibrations.

The initial steps consume equal duration whether originating in Shutdown or Sleep, while the baseband and RF initializations are dependent on the originating state. In particular:

Full baseband initializations are required from Shutdown (including transferring the Factory Information Configuration Registers (FICR) information from OTP memory into retention RAM), while in Sleep some of the state is retained in retention RAMs.

- Full baseband initializations are required from Shutdown (including transferring the Factory Information Configuration Registers (FICR) information from OTP memory into retention RAM), while in Sleep some of the state is retained in retention RAMs.

- Complete RF calibrations are required from Shutdown, including across channels to support scanning. From Sleep, only minimal initialization or calibration on the operating channel is required.

See Electrical specification on page 34 for timing information.

7.3. Clock accuracy considerations

The crystal oscillator is active during normal operation, and is the clock reference for the RF synthesizer, the Analog-to-Digital Converter (ADC)/Digital-to-Analog Converter (DAC) sample clocks, and the baseband logic. The RTC is active during sleep state, and is used to run the wakeup timer used as part of Wi-Fi Power Save. The crystal oscillator is inactive during sleep.

The IEEE 802.11 specification defines the accuracy of the Wi-Fi carrier frequency to be within ± 20 ppm (in 5 GHz), which in turn defines the required accuracy of the external crystal. There is provision to trim the crystal oscillator through a value programmed into the OTP memory on the AN7002Q device (or any other available non-volatile memory). This trimming will compensate for the combined frequency offset resulting from the crystal itself as well as any crystal oscillator variation at room temperature. The crystal and crystal oscillator will both exhibit frequency drift across temperature, and the crystal will also be subject to aging. The combination of these temperature and aging effects, along with the trimming accuracy, will consume the majority of the ± 20 ppm allowance, assuming a crystal with ± 10 ppm stability over temperature. The crystal tolerance (that is, accuracy at room temperature) is less important since this will be trimmed out by the crystal oscillator trim function (up to ± 20 ppm). The crystal oscillator/crystal is typically trimmed by transmitting Wi-Fi packets through the antenna connector and using a Vector Signal Analyzer (VSA) to

measure the frequency offset. Alternatively, a generic spectrum analyser can be used to measure the frequency offset on a transmitted Carrier Wave (CW).

The RTC is automatically calibrated against the trimmed 40 MHz crystal oscillator reference at runtime, and as such nothing needs to be done on the production line. During sleep, the RTC clocked wakeup timer is used to time wakeup intervals (since the last Delivery Traffic Indication Message (DTIM) beacon in regular Wi-Fi Power Save), and as such any residual inaccuracy is not accumulated.

8.   Coexistence

AN7002Q Series devices have a highly configurable coexistence hardware to help mitigate interference between WLAN and Bluetooth LE/IEEE 802.15.4 devices (Thread, Zigbee).

A Packet Traffic Arbitration (PTA) module, connected to the CH logic function, facilitates the mitigation of various interference scenarios through a highly-programmable fabric. The coexistence hardware enables the output signal that supports interface configurations 4-wire. The primary schemes supported are:

- Separate Antenna mode – The PTA makes priority decisions, granting TX/RX requests from Bluetooth LE/IEEE 802.15.4. Each interface is permanently connected to its own antenna.

The following figure shows the architecture of the coexistence hardware with details about the PTA control lines.
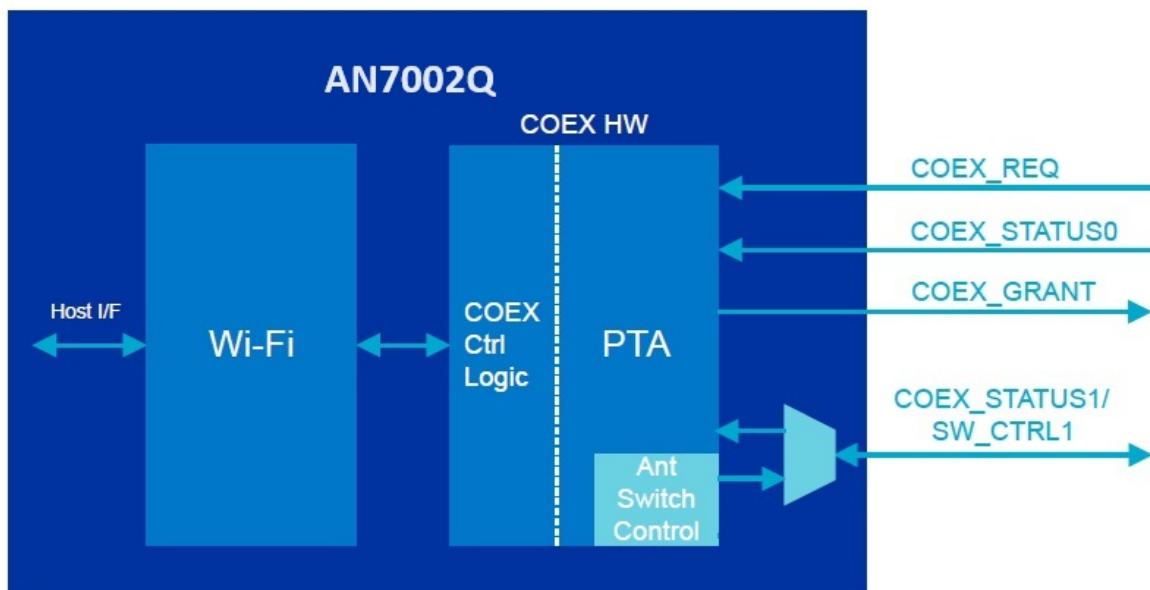

Signal name	I/O	Requirement	Bluetooth LE/ IEEE 802.15.4 signal (3-wire/4-wire)	Description
COEX_REQ	Input	Mandatory for 3-wire and 4-wire	SR_REQUEST	Bluetooth LE/IEEE 802.15.4 device requesting a TX/ RX transaction
COEX_STATUS0	Input	Mandatory for 3-wire and 4-wire	SR_STATUS	Indicates if the Bluetooth LE/ IEEE 802.15.4 transaction is TX or RX. If the device supports a Priority signal, Priority is muxed with TX/RX on this signal based on the timing diagrams.
COEX_GRANT	Output	Mandatory for 3-wire and 4-wire	SR_GRANT	Indicates that the Bluetooth LE/IEEE 802.15.4 device is granted access for this transaction.
COEX_STATUS1/ SW_CTRL1	Input/ Output	Optional for 3-wire	SR_PTI/ RF_SW_CTRL1	In 4-wire mode, this carries the Bluetooth LE/ IEEE 802.15.4 1 bit priority signal. In 3-wire Shared Antenna mode, this can be optionally used as a second antenna switch control signal.

8.1. Bluetooth LE/IEEE 802.15.4 timing

This section provides Bluetooth LE/IEEE 802.15.4 timing diagrams and parameters

3-wire with multiplexed priority

The following diagram shows external Bluetooth LE/IEEE 802.15.4 timing parameters when SR_STATUS

carries both priority and TX/RX information in a time multiplexed manner.
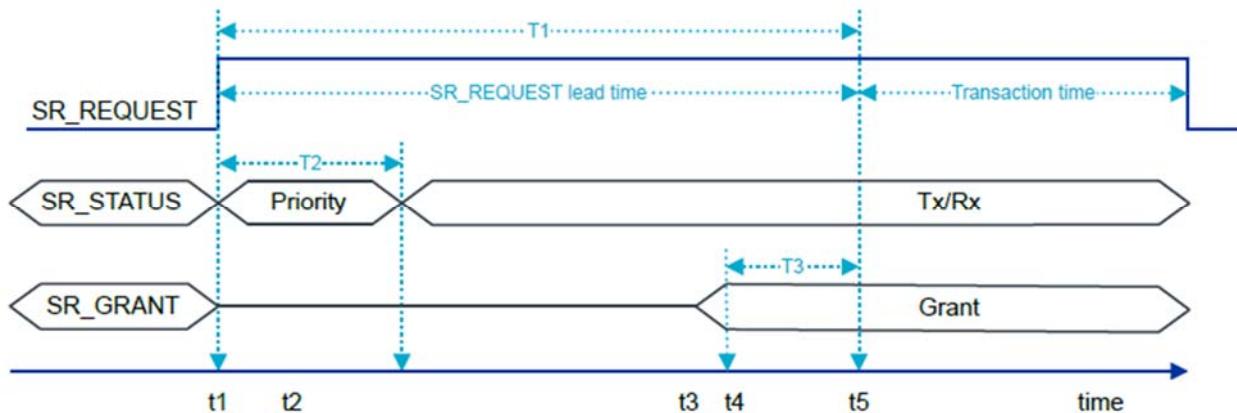

Parameter	Description
T1: SR_REQUEST lead time period	The time SR_REQUEST is asserted before actual transactions.
T2: SR_STATUS	The time when SR_STATUS is sampled to get SR_PTI information.
T3: SR_GRANT	The time before PTA should post SR_GRANT so that it is stable to be considered by the Bluetooth LE/IEEE 802.15.4 device.

The Bluetooth LE/IEEE 802.15.4 timing parameters are used to derive PTA timing parameters. The following table describes the relationship between PTA timing parameters and Bluetooth LE/IEEE 802.15.4 timing parameters.

PTA timing parameter	Relation with Bluetooth LE/IEEE 802.15.4 timing parameter
Bluetooth LE/IEEE 802.15.4 device status priority sampling time (t2)	$t1 < t2 < (t1+T2)$
PTA arbitration decision time (t3)	$(t1+T2) < t3 < (T1-T3)$

Time instance	Description
t1	The time instance when SR_REQUEST is asserted.
t2	The time instance when SR_STATUS is sampled to get SR_PTI information. This can be any time during T2.
t3	The time instance when PTA takes an arbitration decision and posts SR_GRANT to the Bluetooth LE/IEEE 802.15.4 device. This is chosen a couple of microseconds before the start of the *SR grant lead time period*. This ensures that SR_GRANT is asserted as close to *SR grant lead time period* and is stable by the time the Bluetooth LE/IEEE 802.15.4 device uses this information to continue or abort the transaction.
t4	The time instance when the *SR grant lead time period* starts. This is the time when SR_GRANT must be stable to be considered by the Bluetooth LE/IEEE 802.15.4 device.
t5	The time instance when the actual transaction of the Bluetooth LE/IEEE 802.15.4 device starts. This is the time when the signaling period ends and the transaction period starts. Bluetooth LE/IEEE 802.15.4 Tx and Rx information is provided by changing the SR_STATUS signal level appropriately. PTA should track SR_STATUS if SR_REQUEST is high and update the information SR_TX_RX.

3-wire without multiplexed priority

If SR_STATUS carries only one parameter information (3-wire, no priority mode), then the default
information that it carries is SR_TX_RX. In this case, SR_STATUS is set to TX or RX when SR_REQUEST is HIGH. The following diagram shows SR_STATUS only carrying TX/RX information. The signals are represented as a bus even though they are single bit ports to indicate transitions happening on the ports.
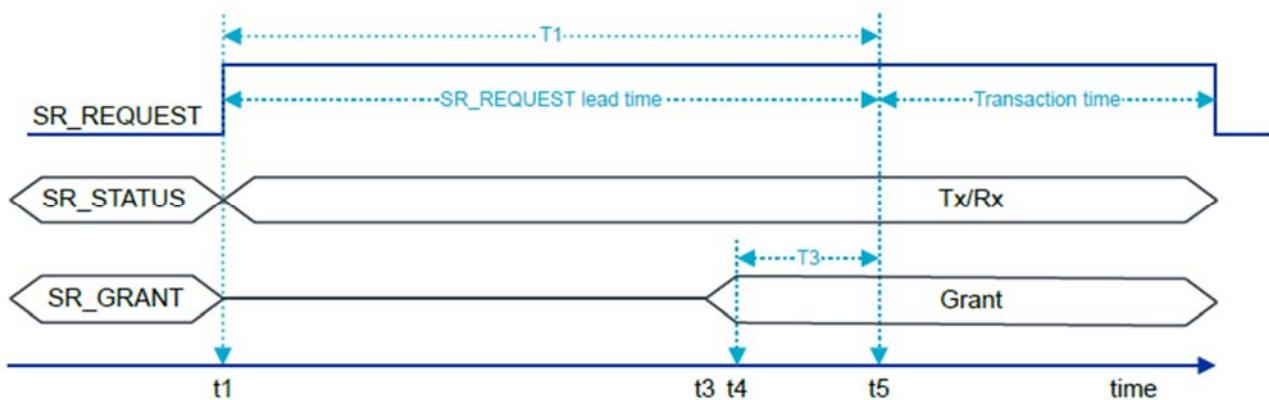

During the transaction, the Bluetooth LE/IEEE 802.15.4 device changes SR_STATUS appropriately to indicate TX and RX information. PTA continuously tracks SR_STATUS while SR_REQUEST is high and updates SR_TX_RX status internally for corresponding COEX behavior.

4-wire timing

In the following diagram, Bluetooth LE/IEEE 802.15.4 priority is explicitly signaled on the BT_COEX_STATUS1 pin.
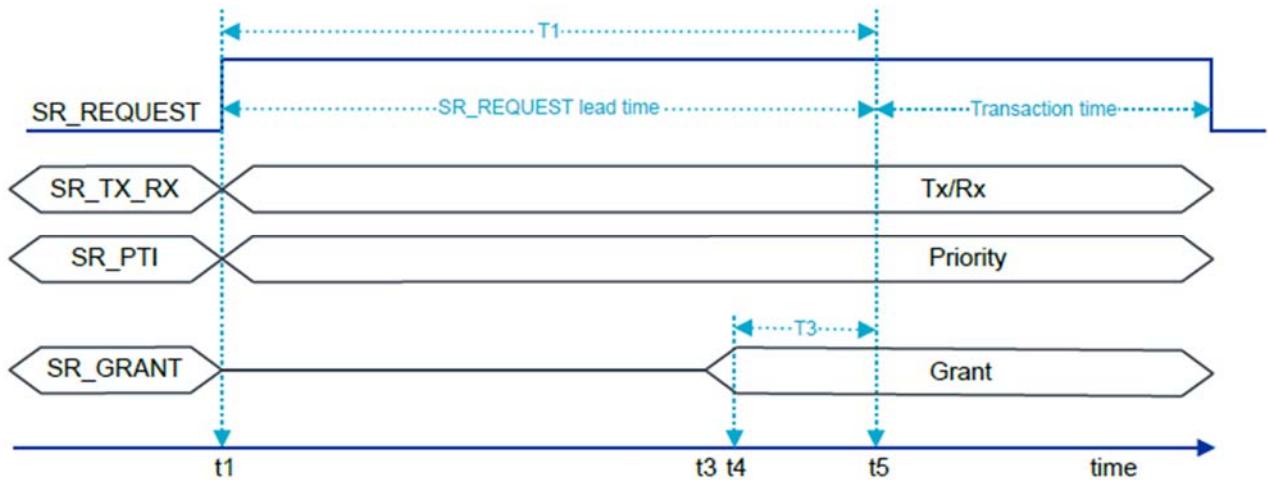

9. OTP memory programming

AN7002Q includes a 128 x 32-bit OTP memory. This memory is partitioned into two regions, a factory
programmed region and a customer programmed region, each containing 64 x 32-bit locations.

The factory programmed region contains information related to production and trim values. The customer
programmed region contains:

- Encryption key used to protect the QSPI traffic (4 words)

- MAC addresses for VIF0 and VIF1 (4 words)

- Module level calibration coefficient (1 word)

- OTP memory protection control (4 words)

- Default register control (1 word)

- Reserved (24 words)

- User data region (26 words)

QSPI encryption is optional. This is enabled at runtime through a QSPI command. If this
feature is not required, the OTP memory locations can remain unprogrammed. For security
reasons, the encryption key cannot be read once programmed.

The MAC address fields in the OTP memory are accessed by firmware when powering up
the device and presented to the host through an SPI/QSPI-based event as part of the boot
phase. The host driver is responsible for configuring the MAC addresses as part of device
configuration. As such, the MAC addresses stored in OTP memory can be overwritten by the
host. Using this mechanism, the MAC addresses in the OTP memory can remain
unprogrammed if an alternate host side storage is used.

The only module level calibration coefficient is the crystal oscillator trim. This is required to
minimize the frequency offset resulting from the external 40 MHz crystal. See Device
Commissioning and Characterization for information related to calibration.

Although the OTP memory is one time programmable, any bit still in a 1 state can be
reprogrammed into a 0 state. To avoid deliberate or inadvertent modification of the OTP
memory data, a protection mechanism is provided. The protection registers initially need to
be programmed to 0x50FA50FA in order to activate programming of the remaining locations.

Once OTP memory programming is complete, the protection registers should be programmed to 0x00000000, at which point the OTP memory can never be modified.
In addition to the logical protection mechanism described above, a programming voltage needs to be applied to the OTPVDD pin in order to enable programming. The programming voltage is 2.5 V, while for reads it is 1.8 V. To coordinate the OTPVDD supply voltage with read and write operations, it is recommended to drive this supply from the POWERIOVDD output pin on AN7002Q. This also ensures there will be no leakage associated with the OTP memory across sleep cycles, where the digital supply rail is removed.

The OTP memory is indirectly mapped, and as such read and writes are achieved using address, data, and mode registers. The OTP memory programming utility implements this programming, along with appropriate control of the OTPVDD supply through the POWERIOVDD output.

10. FICR - factory information configuration registers

The Factory Information Configuration Registers (FICR) are stored in the OTP memory.

FICR has two regions:

• A factory-programmed region that contains device information and has the INFO group registers.

• A customer-programmable region that contains empty registers for the customer to write data to. It

has the QSPI, MAC, and CALIB group registers.

Access to the customer-programmable region is controlled using the PROTECTION register.

The PROTECTION scenarios are:

• When PROTECTION is unprogrammed, neither read not write is enabled.

• When PROTECTION is programmed to 0x50FA50FA, full read and write access is enabled.

• When PROTECTION is programmed to 0x00000000, access protection is applied and readout of

QSPI.KEY is prevented.

The following table shows the access protection for the different register groups.

Register group	0xFFFFFFFF	0x50FA50FA	0x00000000
QSPI.KEY	-	R/W	-
MAC.ADDRESS	-	R/W	R
CALIB	-	R/W	R

11. Antenna

Below chart shows a few options of external antenna which has been tested and approved to use with AN7002Q-U. Please check 錯誤! 找不到參照來源。. 錯誤! 找不到參照來源。 for more details.

#	Photo	Model No.	Type	Supplier	Gain	Spec	Certification
1		SRE3W084-S9P	External	Antenova	3.1dBi @2.4G 5.2dBi @5G		FCC, ISED, CE AS, TELEC, KDSRRC, NCC
2		ANTX100 ETHAB24553	External	Yageo	2.0dBi @2.4G 3.0dBi @5G		FCC, ISED, CE AS, TELEC, KD SRRC, NCC
3		SRF2W012-100	PCB	Antenova	2.9dBi @2.4G 4.5dBi @5G		FCC, ISED, CE AS, TELEC, KD SRRC, NCC
4		2344655-1	PCB	TE Connectivity	1.4dBi @2.4G 3.7dBi @5G		FCC, ISED, CE AS, TELEC, KD SRRC, NCC

* End-product may need to perform further testing when applying CE, RCM and SRRC. Others are modular approval.

* Our certificate(s) might not be applicable when using antenna apart from above list.

12. Reference circuit

AN7002Q-DB-5340 Schematic

Version: A02
Date:2025.01.21
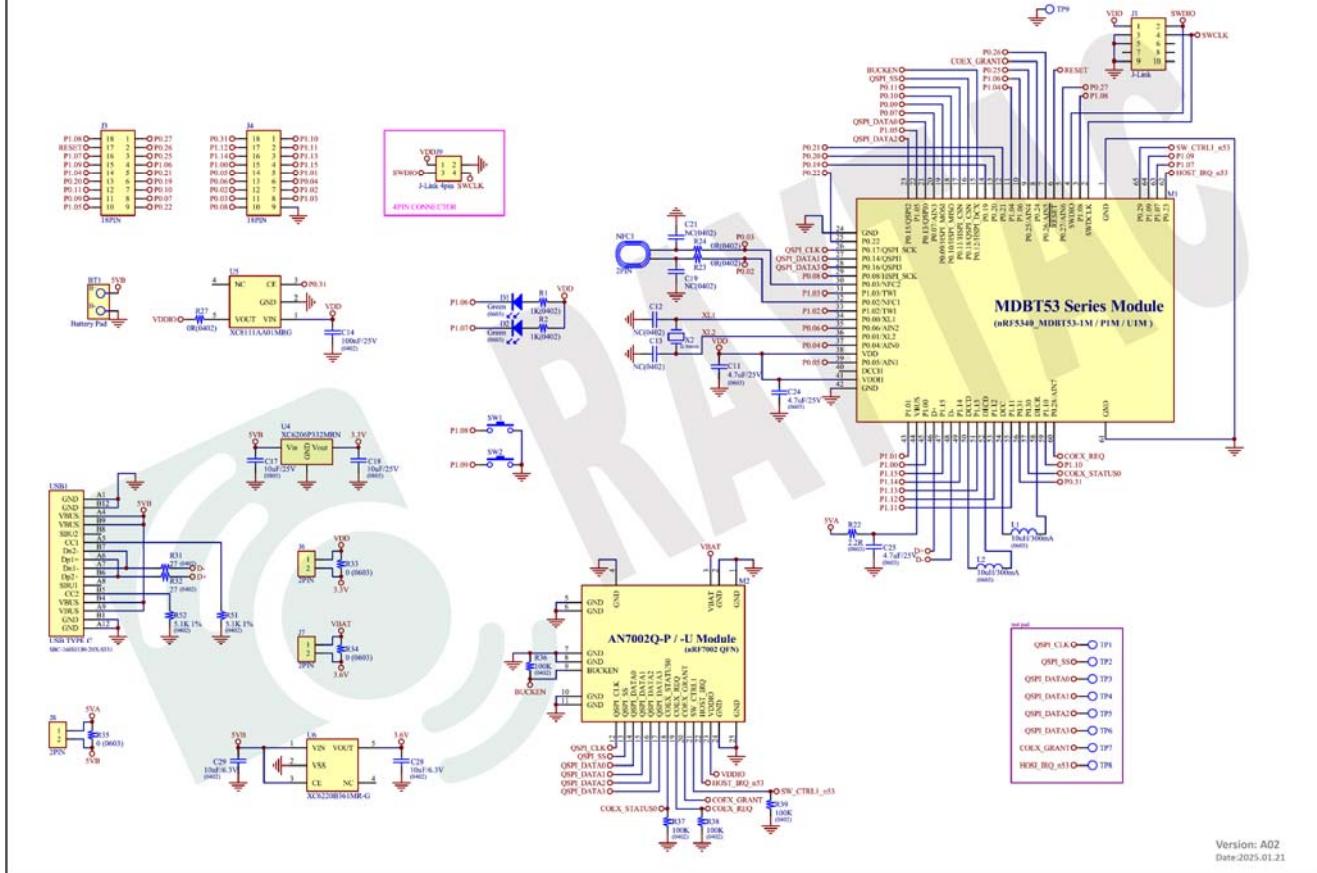

13. Notes and cautions

Module is not designed to last for a lifetime. Like general products, it is expected to be worn out after continuous usage through the years. To assure that product will perform better and last longer, please make sure you:

- Follow the guidelines of this document while designing circuit/end-product. Any discrepancy of core Bluetooth technology and technical specification of IC should refer to definition of Bluetooth Organization and Nordic Semiconductor as final reference.

- Do not supply voltage that is not within range of specification.

- Eliminate static electricity at any cost when working with the module as it may cause damage. It is highly recommended adding anti-ESD components to circuit design to prevent damage from real-life ESD events. Anti-ESD methods can be also applied in mechanical design.

- Do not expose modules under direct sunlight for long duration. Modules should be kept away from humid and salty air conditions, and any corrosive gasses or substances. Store it within -40℃ to +125℃ before and after installation.

- Avoid any physical shock, intense stress to the module or its surface.

- Do not wash the module. No-Clean Paste is used in production. Washing it will oxidize the metal shield and have chemistry reaction with No-Clean Paste. Functions of the module are not guaranteed if it has been washed.

The module is not suitable for life support device or system and not allowed to be used in destructive device or systems in any direct or indirect ways. The customer agrees to indemnify Raytac for any losses when applying modules in applications such as the ones described above.

14. Useful links

- Nordic infocenter: https://docs.nordicsemi.com/
  All the necessary technical files and software development kits of Nordic's chip are on this website.

- Nordic DevZone: https://devzone.nordicsemi.com/questions/
  A highly recommended website for firmware developer. Interact, discuss and consult with other fellow developers and Nordic's employees to get answers to your questions. The site also includes tutorials in detail to help you get started.

- Official page of nRF7002 : https://www.nordicsemi.com/Products/nRF7002
  A brief introduction to nRF7002 and download links for Nordic's developing software and SoftDevices.

Release note

- 2025/01/21　Version 0.1: Preliminary.

FCC

This module has been tested and found to comply with the following requirements for Modular Approval.

- Part 15.247 – Operation within the bands 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz.

- Part 15.407 – General technical requirements.

Required End Product Labeling

Any device incorporating this module must display an external, visible, permanently affixed label with the FCC ID and the ISED certification number preceded by the term as follows.

" **Contains FCC ID:**SH6MDAN7002Q"

" **Contains IC:**8017A-AN7002Q "

Obligation d'étiquetage du produit final:

Tout appareil intégrant ce module doit afficher une étiquette externe, visible et apposée en permanence avec le numéro de certification ISDE précédé du terme comme suit.

« **Contient IC :**8017A-AN7002Q »

The OEM integrator has to be aware not to provide information to the end user regarding how to install or remove this RF module in the user's manual of the end product which integrates this module. The end user manual shall include all required regulatory information/warning as shown in User manual.

L'intégrateur OEM doit s'assurer de ne pas fournir d'informations à l'utilisateur final sur la façon d'installer ou de retirer ce module RF dans le manuel d'utilisation du produit final qui intègre ce module. Le manuel de l'utilisateur final doit inclure toutes les informations/avertissements réglementaires requis, tel qu'indiqué dans le manuel de l'utilisateur.

RF exposure considerations

1. The host product operating conditions must be such that there is a minimum separation distance of 20 cm (or possibly greater than 20 cm) between the antenna radiating structures and nearby persons. The host manufacturer is obligated to confirm the use conditions of the host product to ensure that the distance specified in the instructions is met. In this case the host product is classified as either a mobile device or a fixed device for RF exposure purposes.

2. If the modular transmitter to be used in a specific type of host platform and installed such that it can be operated at closer than 20 cm to users or nearby persons, please follow below guidance.

   a. For the host product integrated with this modular transmitter as a stand-alone configuration, the maximum conducted power from the original grant shall be retained in order to meet SAR exemption requirements.

   b. For configuration with multiple transmitters in the same host, routine evaluation or SAR testing for the simultaneous transmission of the co-located transmitters according to KDB 447498 is required. The potable host product shall be evaluated for ensuring to continue compliance FCC rule part 2.1093 & part 1.1310 by C2PC. The additional guidance for the portable host products is provided in KDB Publication 996369 D02 and D04.

c.   For the host product is not installed according to this guide, the module certification will be invalid, and a new grant certification will be required for the host product.

1.   Les conditions de fonctionnement du produit hôte doivent être telles qu'il existe une distance de séparation minimale de 20 cm (ou éventuellement supérieure à 20 cm) entre les structures rayonnantes de l'antenne et les personnes à proximité. Le fabricant hôte est tenu de confirmer les conditions d'utilisation du produit hôte pour s'assurer que la distance spécifiée dans les instructions est respectée. Dans ce cas, le produit hôte est classé comme un appareil mobile ou un appareil fixe aux fins d'exposition aux RF.

2.   Si l'émetteur modulaire doit être utilisé sur un type spécifique de plateforme hôte et installé de manière à pouvoir être utilisé à moins de 20 cm des utilisateurs ou des personnes à proximité, veuillez suivre les instructions ci-dessous.

a.   Pour le produit hôte intégré à cet émetteur modulaire en tant que configuration autonome, la puissance conduite maximale de la subvention d'origine doit être conservée afin de répondre aux exigences d'exemption SAR.

b.   Pour une configuration avec plusieurs émetteurs dans le même hôte, une évaluation de routine ou un test SAR pour la transmission simultanée des émetteurs colocalisés conformément à la norme KDB 447498 est nécessaire. Le produit hôte potable doit être évalué pour garantir le maintien de la conformité par un changement permissif ultérieur. Des instructions supplémentaires pour les produits hôtes portables sont fournies dans la publication KDB 996369 D02 et D04.

c.   Si le produit hôte n'est pas installé conformément à ce guide, la certification du module sera invalide et une nouvelle certification sera requise pour le produit hôte.

Antennas

This radio transmitter has been approved by the FCC and ISED to operate with the antenna types listed below with the maximum permissible gain indicated.

Antenna types not included in this list shall be re-assessed by a subsequent permissive change.

The OEM must design the host so that the antenna will be installed as an integrated antenna for the host and the end user shall not be able to access, remove or replace the antenna.

Antennes

Cet émetteur radio a été approuvé par ISDE pour fonctionner avec les types d'antennes énumérés ci-dessous avec le gain maximal autorisé indiqué.

Les types d'antennes non inclus dans cette liste doivent être réévalués pour des modifications permissibles ultérieures.

L'OEM doit concevoir l'hôte de manière à ce que l'antenne soit installée comme une antenne intégrée pour l'hôte et que l'utilisateur final ne puisse pas accéder, retirer ou remplacer l'antenne.

Brand	Model No.	Antenna Type	Freq. (MHz)	Max. Peak Antenna

				Gain (dBi)
Antenova Limited	SRE3W084-S9R	Dipole	2412-2462	3.1
			5150-5895	5.2
YAGEO	ANTX100ETHAB24553	Dipole	2412-2462	2
			5150-5895	3

			5150-5895	4.5
TE Connectivity	2344655-1	Monopole	2412-2462	1.4
			5150-5895	3.7
Raytac	AN7002Q	Monopole	2412-2462	0.94
			5150-5895	4.68
Raytac	AN7002Q-P	PIFA	2412-2462	2.2
			5150-5895	4.84

Test Modes

This device uses various test mode programs for test set up which operate separate from production firmware. Host integrators should contact the grantee for assistance with test modes needed for module/host compliance test requirements.

Additional testing, Part 15 Subpart B disclaimer

The modular transmitter is only FCC authorized for the specific rule parts (i.e., FCC transmitter rules) listed on the grant, and that the host product manufacturer is responsible for compliance to any other FCC rules that apply

to the host not covered by the modular transmitter grant of certification.

The final host product still requires Part 15 Subpart B compliance testing with the modular transmitter installed.

Note EMI Considerations

Note that a host manufacture is recommended to use KDB996369 D04 Module Integration Guide recommending as "best practice" RF design engineering testing and evaluation in case non-linear interactions generate additional non-compliant limits due to module placement to host components or properties.

For standalone mode, reference the guidance in KDB996369 D04 Module Integration Guide and for simultaneous mode; see KDB996369 D02 Module Q&A Question 12, which permits the host manufacturer to confirm compliance.

How to make changes

Only Grantees are permitted to make permissive changes, if the module will be used differently than granted conditions, please contact us to ensure modifications will not affect compliance.

Contact Information

Company Name: Raytac Corp.

Address: 5F.-1, No. 145, Sec. 1, Heping E. Rd., Da'an Dist., Taipei City 106010 , Taiwan (R.O.C.)

FCC

You are cautioned that changes or modifications not expressly approved by the part responsible for compliance could void the user's authority to operate the equipment.

ISED

This device contains licence-exempt transmitter(s)/receiver(s) that comply with Innovation, Science and Economic Development Canada's licence-exempt RSS(s). Operation is subject to the following two conditions:

1. This device may not cause interference, and

2. This device must accept any interference, including interference that may cause undesired operation of the device.

L'émetteur/récepteur exempt de licence contenu dans le présent appareil est conforme aux CNR d'Innovation, Sciences et Développement économique Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes :

1. l'appareil ne doit pas produire de brouillage, et

2. l'utilisateur de l'appareil doit accepter tout brouillage radioelectrique subi, meme si le brouillage est susceptible d'en compromettre le fonctionnement.

Operation in 5150~5250MHz & 5850~5895MHz is for indoor use only.

Le fonctionnement en 5150 à 5250 MHz et 5850 à 5895 MHz est réservé à une utilisation à l'intérieur uniquement.

TELEC

5GHz band (W52,W53): Indoor use only
