

Connection of wireless receiver to computer

Ch

The receiver has two lights that indicate the strength of the received signals transmitted wirelessly over radio. The Right light is for the Blue transmitter, and the left one for the White transmitter. For strong radio signals, the lights will be continuously on. The lights may flicker for weak signals, for example, in the case of plastic pipes, or when correlating leaks in metal pipes over long distances. For very weak signals the lights will go off, however, you may still be able to successfully correlate a leak even if radio signal lights are off.

Checking the strength of wireless radio signals
