TEST SUMMARY

The product was tested in accordance with the following standards.

Test Results Summary

Test Standards	Description	Pass / Fail
<ul style="list-style-type: none">Supplement C (Edition 01-01) to FCC OET Bulletin 65 (Edition 97-01)ANSI/IEEE Standard C95.1-1993	SAR Measurement (Wi-Fi 2450MHz) Body worn Configuration Only	Pass *

1. The worst-case SAR value was found to be **1.430W/kg** which is lower than the maximum limit of 1.60 W/kg, over 1g of tissue. The device conforms to the requirements of the standard when the maximum measured SAR value is less than or equal to the limit.

* Based on spatial peak uncontrolled exposure / general population level:
Head: 1.60 W/kg, over 1g of tissue.
Body: 1.60 W/kg, over 1g of tissue.

Modifications

No modifications were made.

DEVICE DESCRIPTION

DEVICE DESCRIPTION

Description	The Equipment Under Test (EUT) is a Wi-Fi Notebook
Device Category	Portable Device
Exposure Environment	General Population/Uncontrolled exposure
Test Device Type	Production Unit
Brand Name	Malata
Serial Numbers	NIL
Model	PC-81007
FCC ID	SMFPC81007

DEVICE OPERATING CONFIGURATION

Operating Frequencies	<u>Wi-Fi mode</u> Channel 1 (2412Mhz) Channel 2 (2442Mhz) Channel 3 (2462Mhz)
Operating Temperature Tolerance	(0 ~ 80) Degree Celsius
Operating Voltage Tolerance	(3.3 ±5%) Volt DC
Continuous Transmission Tolerance	The EUT shall cause no problem after transmitting for 4 hours.
Rated Output Power	16dBm ± 1.5dBm, Maximum (802.11b) 13dBm ± 1.5dBm, Maximum (802.11g)
Antenna Type	PIFA Integrated Antenna
EUT Crest Factor	1.0
Input Power	AC 100~240V, DC 12V, Rechargeable Battery
Accessories	Power adapter

MANUFACTURER

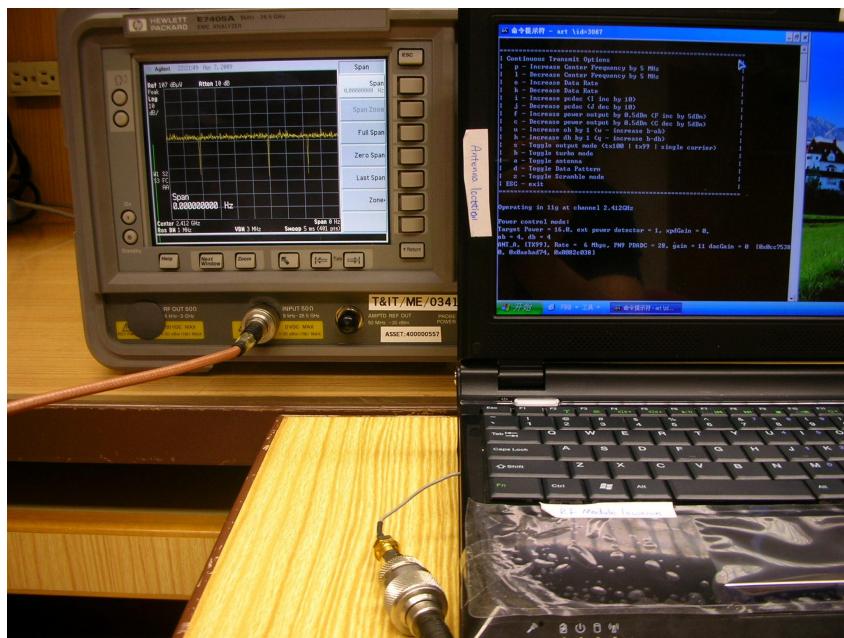

Manufacturer Address	Wanlida Group Co., Ltd. No. 618 Jiahe Road Xiamen Fujian, China
DID	(+86) 596-7653999-826
Fax	(+86) 596-7662886

DEVICE OPERATING CONDITION

DEVICE OPERATING CONDITION

The EUT has dual-antenna connected to a single WiFi module and only one antenna operates at a single time. SAR was evaluated with individual antenna (toggle by software) with the radio transmitting at the 6Mbps and 11Mbps data rate for each mode based on the measured conducted power.

The EUT was put into exercised by using software control operating at the following frequencies 2.412GHz, 2.442GHz and 2.462GHz (lowest, middle and highest channel). The EUT was set to maximum output power level transmission (greater than 90% on-time), this was confirm with a spectrum analyser set to zero span as shown below set up.

TEMPERATURE AND HUMIDITY

802.11b/g (Body)

Ambient Temperature: $24 \pm 1^{\circ}\text{C}$

Tissue Temperature: $24 \pm 1^{\circ}\text{C}$

Humidity: 54% to 59%

TEST RESULTS

The measurement results were obtained with the EUT tested in the conditions described in this report (Annex A).

Remarks:

1. All modes of operations were investigated and the worst-case SAR levels are reported.
2. A fully charged **Li-Polymer** Battery Description **DC 7.4V, 4000mAh** was used for each mode of operation.
3. For the peak power measurement across all the data rates are listed in page 57 - 60 of this report.
4. For **Wi-Fi 6Mbps-Antenna B** the worst-case SAR value was found to be **1.4W/Kg** (over a 1g tissue) at **Channel 3** which is lower than the maximum limit of 1.60 W/Kg, please refer to the above table.
5. For **Wi-Fi 11Mbps-Antenna B**, the worst-case SAR value was found to be **1.43W/Kg** (over a 1g tissue) at **Channel 2** which is lower than the maximum limit of 1.60 W/Kg, please refer to the above table.
6. The SAR limit of 1.60W/Kg (Spatial Peak level for Uncontrolled Exposure / General Population) is based on the Test Standards:
 - a) Supplement C (Edition 01-01) to FCC OET Bulletin 65 (Edition 97-01)
 - b) ANSI/IEEE Standard C95.1-1993
7. Others consideration used for the above test:
 - i) KDB 248227 dated May 2007
 - ii) KDB 447498 D01 dated Jan 2009

A.1 General Test Procedure

In the SAR measurement, the positioning of the probes must be performed with sufficient accuracy to obtain repeatable measurements in the presence of rapid spatial attenuation phenomena. The accurate positioning of the E-field probe is accomplished by using a high precision robot. The robot can be taught to position the probe sensor following a specific pattern of points. In a first sweep, the sensor is positioned as close as possible to the interface, with the sensor enclosure touching the inside of the fiberglass shell. The SAR is measured on a grid of points, which covers the curved surface of the phantom in an area larger than the size of the EUT. After the initial scan, a high- resolution grid is used to locate the absolute maximum measured energy point. At this location, attenuation versus depth scan will be accomplished by the measurement system to calculate the SAR value.

ANNEX A

A.3 Test Setup

Phantom

The "Phantom SAM 12", manufactured by SPEAG is a fiberglass shell phantom with 2 mm shell thickness. It has three measurement areas:

- Left hand
- Right hand
- Flat phantom

The "Phantom SAM 12" table comes in the sizes: A 100x50x85 cm (LxWxH). The bottom plate contains three pair of bolts for locking the device holder. The device holder positions are adjusted to the standard measurement positions in the three sections. Only one device holder is necessary if two phantoms are used (e.g., for different solutions).

Simulated tissue

Simulated Tissue: Suggested in a paper by George Hartsgrove and colleagues in University of Ottawa Ref.: Bioelectromagnetics 8:29-36 (1987)

This simulated tissue is mainly composed of water, sugar and salt. At higher frequencies, in order to achieve the proper conductivity, the solution does not contain salt. Also, at these frequencies, D.I. water and alcohol is preferred.

Tissue Density : Approximately 1.25 g/cm³

Preparation

The ingredients (i.e. water, sugar, salt, etc) required to prepare the simulated tissue are carefully weighed and poured into a clean container for mixing. A stirring paddle, that is attached to a hand drill is used to stir the solution for a duration of about 30 minutes or more. When the ingredients are completely dissolved, the solution is left in the container for the air bubbles to disappear.

Measurement of Electrical Characteristics of Simulated Tissue

- 1) S-PARAMETER Network Analyzer, Agilent 8753ES (30kHz – 6GHz)
- 2) Agilent 85070D Dielectric Probe Kit

TEST INSTRUMENTATION & GENERAL PROCEDURES

ANNEX A

ELECTRICAL CHARACTERISTIC MEASUREMENT SETUP

- Description of the Agilent 85070D Dielectric Probe Kit**

The 85070D is a dielectric probe that is used to measure the intrinsic electrical properties of materials in the RF and microwave frequency bands. The 85070D software allows you to measure the complex dielectric constant (also called permittivity) of liquids and semi-solids, including the dielectric loss factor or loss tangent.

To obtain data at hundreds of frequencies in seconds, simply immerse the probe into liquids or semi-solids - no special fixtures or containers are required. The 85070D must be used in conjunction with an Agilent network analyzer. The network analyzer provides the high frequency stimulus, and measures the reflected response.

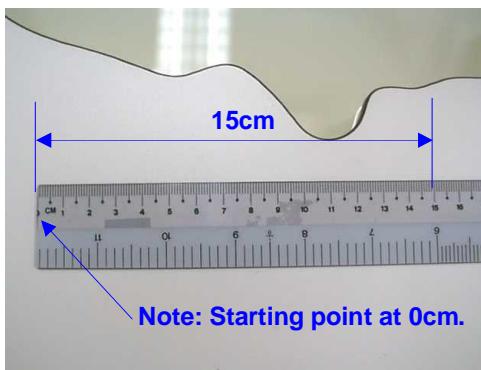

The probe transmits a signal into the material under test (MUT). The measured reflected response from the materials is then related to its dielectric properties. A computer controls the system, and runs software that guides the user through a measurement sequence. An effort is made to keep the results dielectric constant and conductivity within 5 % of published data.

Tissue Depth

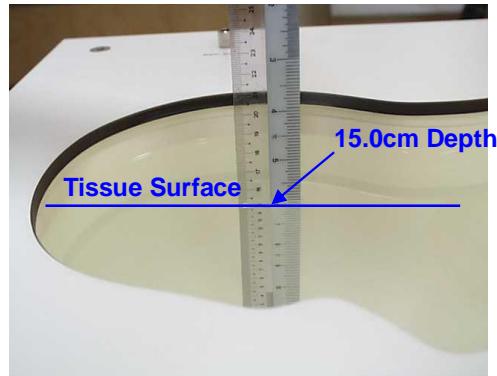

The tissue depth at the "Phantom SAM 12", "450MHz Flat Phantom – 6mm Shell Thickness" & "450MHz Flat Phantom – 2mm Shell Thickness" is approximately 15cm ± 0.5 cm.

Tissue – 15.0cm Depth

The DASY4 holder is designed to cope with different positions given in the standard. It has two scales for the device rotation (with respect to the body axis) and the device inclination (with respect to the line between the ear openings). The plane between the ear openings and the mouth tip has a rotation angle of 65°. The intended use position in the CENELEC document is has a rotation angle of 65° and an inclination angle of 80°. The rotation centers for both scales is the ear opening. Thus the device needs no repositioning when changing the angles. The device rotation around the device axis is not changed in the holder. In the CENELEC standard it is always 0°. If the standard changes, a support will be provided with the new angle.

1. **"Cheek/Touch Position"** – the device is brought toward the mouth of the head phantom by pivoting against the "ear reference point" or along the "N-F" line for the SCC-34/SC-2 head phantom. This test position is established:
 - i) When any point on the display, keypad or mouthpiece portions of the handset is in contact with the phantom.
 - ii) (Or) When any portion of a foldout, sliding or similar keypad cover opened to its intended self-adjusting normal use position is in contact with the cheek or mouth of the phantom.

For existing head phantoms – when the handset loses contact with the phantom at the pivoting point, rotation should continue until the device touches the cheek of the phantom or breaks its last contact from the ear spacer.

2. **"Ear/Tilt Position"** – With the handset aligned in the "Cheek/Touch Position":

TEST INSTRUMENTATION & GENERAL PROCEDURES

ANNEX A

- i) If the earpiece of the handset is not in full contact with the phantom's ear spacer (in the "Cheek/Touch position") and the peak SAR location for the "Cheek/Touch" position is located at the ear spacer region or corresponds to the earpiece region of the handset, the device should be returned to the "initial ear position" by rotating it away from the mouth until the earpiece is in full contact with the ear spacer.
- ii) (Otherwise) The handset should be moved (translated) away from the cheek perpendicular to the line passes through both "ear reference points" (note: one of these ear reference points may not physically exist on a split head model) for approximate 2-3 cm. While it is in this position, the handset is tilted away from the mouth with respect to the "test device reference point" by 15°. After the tilt, it is then moved (translated) back toward the head perpendicular to the line passes through both "ear reference points" until the device touches the phantom or the ear spacer. If the antenna touches the head first, the positioning process should be repeated with a tilt angle less than 15° so that the device and its antenna would touch the phantom simultaneously. This test position may require a device holder or positioner to achieve the translation and tilting with acceptable positioning repeatability.

3. Body Worn Configuration

All body worn accessories are tested for the FCC RF exposure compliance. The phone is positioned into carrying case (if available) and placed below of the flat phantom. Headset or ear piece (if available) is connected during measurements.

4. System Checking

The manufacturer calibrates the probe annually. Dielectric parameters of the tissue stimulants were measured every day using the dielectric probe kit and network analyser 8753ES. Refer to annex C. A system check measurement was made following the determination of the dielectric parameters of the stimulant using the dipole validation system. A power level of 250mW was supplied to the dipole antenna which was placed under the flat section of the twin SAM phantom. The system checking results (dielectric parameters and SAR values) are in Annex D.

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).
 The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature (22 ± 3)°C and humidity < 70%.

Glossary:

TS	tissue simulating liquid
NORM _{x,y,z}	sensitivity in free space
ConvF	sensitivity in TS / NORM _{x,y,z}
DCP	diode compression point
Polarization ϕ	ϕ rotation around probe axis
Polarization θ	θ rotation around an axis that is in the plane normal to probe axis (at measurement center), i.e., $\theta = 0$ is normal to probe axis

Calibration is Performed According to the Following Standards:

- IEEE Std 1528-2003, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", December 2003
- IEC 62209-1, "Procedure to measure the Specific Absorption Rate (SAR) for hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz)", February 2005

Methods Applied and Interpretation of Parameters:

- NORM_{x,y,z}:** Assessed for E-field polarization $\theta = 0$ ($f \leq 900$ MHz in TEM-cell; $f > 1800$ MHz: R22 waveguide). NORM_{x,y,z} are only intermediate values, i.e., the uncertainties of NORM_{x,y,z} does not effect the E²-field uncertainty inside TS (see below ConvF).
- NORM(f)x,y,z = NORMx,y,z * frequency_response** (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of ConvF.
- DCPx,y,z:** DCP are numerical linearization parameters assessed based on the data of power sweep (no uncertainty required). DCP does not depend on frequency nor media.
- ConvF and Boundary Effect Parameters:** Assessed in flat phantom using E-field (or Temperature Transfer Standard for $f \leq 800$ MHz) and inside waveguide using analytical field distributions based on power measurements for $f > 800$ MHz. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TS corresponds to NORM_{x,y,z} * ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from ± 50 MHz to ± 100 MHz.
- Spherical isotropy (3D deviation from isotropy):** in a field of low gradients realized using a flat phantom exposed by a patch antenna.
- Sensor Offset:** The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $k=2$, which for a normal distribution corresponds to a coverage probability of approximately 95%.

^A The uncertainties of NormX,Y,Z do not affect the E²-field uncertainty inside TSL (see Page 8).

^B Numerical linearization parameter: uncertainty not required.

Client **TÜV SUD PSB**

Certificate No. **DAE4-627_Jun08**

CALIBRATION CERTIFICATE

Object **DAE4 - SD 000 D04 BA - SN: 627**

Calibration procedure(s) **QA/CAL-06.v12**
Calibration procedure for the data acquisition electronics (DAE)

Calibration date: **June 24, 2008**

Condition of the calibrated item **In Tolerance**

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).
The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature $(22 \pm 3)^\circ\text{C}$ and humidity $< 70\%$.

Calibration Equipment used (M&TE critical for calibration)

Primary Standards	ID #	Cal Date (Certificate No.)	Scheduled Calibration
Fluke Process Calibrator Type 702	SN: 6295803	04-Oct-07 (No: 6467)	Oct-08
Keithley Multimeter Type 2001	SN: 0810278	03-Oct-07 (No: 6465)	Oct-08
Secondary Standards	ID #	Check Date (in house)	Scheduled Check
Calibrator Box V1.1	SE UMS 006 AB 1004	06-Jun-08 (in house check)	In house check: Jun-09

Calibrated by: **Dominique Stoffen** Function: **Technician** Signature: **D. Stoffen**

Approved by: **Flin Bornholt** Function: **R&D Director** Signature: **W. Bornholt**

Issued: June 24, 2008

This calibration certificate shall not be reproduced except in full without written approval of the laboratory.

Glossary

DAE	data acquisition electronics
Connector angle	information used in DASY system to align probe sensor X to the robot coordinate system.

Methods Applied and Interpretation of Parameters

- *DC Voltage Measurement*: Calibration Factor assessed for use in DASY system by comparison with a calibrated instrument traceable to national standards. The figure given corresponds to the full scale range of the voltmeter in the respective range.
- *Connector angle*: The angle of the connector is assessed measuring the angle mechanically by a tool inserted. Uncertainty is not required.
- The following parameters as documented in the Appendix contain technical information as a result from the performance test and require no uncertainty.
 - *DC Voltage Measurement Linearity*: Verification of the Linearity at +10% and -10% of the nominal calibration voltage. Influence of offset voltage is included in this measurement.
 - *Common mode sensitivity*: Influence of a positive or negative common mode voltage on the differential measurement.
 - *Channel separation*: Influence of a voltage on the neighbor channels not subject to an input voltage.
 - *AD Converter Values with inputs shorted*: Values on the internal AD converter corresponding to zero input voltage
 - *Input Offset Measurement*: Output voltage and statistical results over a large number of zero voltage measurements.
 - *Input Offset Current*: Typical value for information; Maximum channel input offset current, not considering the input resistance.
 - *Input resistance*: DAE input resistance at the connector, during internal auto-zeroing and during measurement.
 - *Low Battery Alarm Voltage*: Typical value for information. Below this voltage, a battery alarm signal is generated.
 - *Power consumption*: Typical value for information. Supply currents in various operating modes.

4. AD-Converter Values with inputs shorted

DASY measurement parameters: Auto Zero Time: 3 sec; Measuring time: 3 sec

	High Range (LSB)	Low Range (LSB)
Channel X	15897	16674
Channel Y	16261	16405
Channel Z	15840	16234

5. Input Offset Measurement

DASY measurement parameters: Auto Zero Time: 3 sec; Measuring time: 3 sec

Input 10MΩ

	Average (µV)	min. Offset (µV)	max. Offset (µV)	Std. Deviation (µV)
Channel X	-0.42	-1.54	0.98	0.37
Channel Y	-1.36	-2.42	0.07	0.41
Channel Z	-0.32	-2.65	2.10	0.38

6. Input Offset Current

Nominal Input circuitry offset current on all channels: <25fA

7. Input Resistance

	Zeroing (MOhm)	Measuring (MOhm)
Channel X	0.2001	199.3
Channel Y	0.2001	199.9
Channel Z	0.2001	200.1

8. Low Battery Alarm Voltage (verified during pre test)

Typical values	Alarm Level (VDC)
Supply (+ Vcc)	+7.9
Supply (- Vcc)	-7.6

9. Power Consumption (verified during pre test)

Typical values	Switched off (mA)	Stand by (mA)	Transmitting (mA)
Supply (+ Vcc)	+0.0	+6	+14
Supply (- Vcc)	-0.01	-8	-9
