

COVER LETTER

One2TOUCH has appointed NEMKO to test and approve our products for FCC approval.

One2TOUCH develop and manufacture smart phone keyboards based on NFC wireless technology.

Softpad products are designed to be the first wireless mobile phone keyboard which is based on the Near Field Communication (NFC) technology. Advantages compared to similar products based on other wireless technologies are; security, low power consumption and easy pairing.

Whenever a NFC activated phone is placed within the range of the keyboard antenna, a negotiation is started. The phone induces a 13.56MHz signal onto the keyboard antenna which provides a carrier for communication between phone and keyboard.
