# MAXIMUM PERMISSIBLE EXPOSURE FOR SUBPART C 2.4 GHz BAND ANNOUNCE RADIO

## Calculations

Power density at the specific separation:

$S = PG/(4R^2\pi)$
$S = (0.7709 * 15.85) / (4 * 20^2 * \pi)$
$S = 0.002431$ mW/cm$^2$

where

S = Maximum power density (mW/cm$^2$)
P = Power input to the antenna (mW) = -1.13 dBm
G = Numeric power gain of the antenna
R = distance to the center of the radiation of the antenna (20 cm = limit for MPE)

The maximum permissible exposure (MPE) for the general population is 1 mW/cm$^2$.

The power density at both 20 cm does not exceed the 1 mW/cm$^2$. Therefore, the exposure condition is compliant with FCC rules.

The numeric gain (G) of the antenna with a gain specified in dB is determined by:

$G = Log^{-1}$ (dBi antenna gain/10)
$G = Log^{-1}$ (12 dBi/10)
G = 15.85
