### **3. SYSTEM TEST CONFIGURATION**

#### **3.1 Justification**

The system was configured for testing in a typical fashion (as a customer would normally use it). And its antenna was permanently attached to the EUT. Emissions at the lowest operation frequency (88.1MHz), middle frequency (98.1MHz) and highest frequency ( 107.9MHz) were investigated. The worst case at 107.9MHz operation was recorded for final data. The audio input was set to max. level during the test by adjusting the iPod's volume to its max. output level (pressing Vol. Control button "+" all the way ).

## 5. RADIATED EMISSION DATA

### 5.1 Field Strength Calculation

The corrected field strength is automatically calculated by EMI Receiver using following:

$$FS = RA + AF + CF + AG$$

where FS: Corrected Field Strength in dB $\mu$ V/m

RA: Amplitude of EMI Receiver before correction in dB $\mu$ V

AF: Antenna Factor in dB/m

CF: Cable Attenuation Factor in dB

AG: Built-in Preamplifier Gain in dB (Stored in receiver as part of the calibration data)

### 5.2 Test Methods and Conditions

The initial step in collecting radiated data is a EMI Receiver scan of the measurement range below 30MHz using peak detector and 9KHz IF bandwidth / 30KHz video bandwidth. For the range 30MHz - 1GHz, 120KHz IF bandwidth / 120KHz video bandwidth are used. Both bandwidths are 1MHz for above 1GHz measurement. Up to 10<sup>th</sup> harmonics were investigated.

### 5.3 Test Data

The following data lists the significant emission frequencies, polarity and position, peak reading of the EMI Receiver, the FCC limit, and the difference between the peak reading and the limit. Explanation of the correction and calculation are given in section 5.1.

Emissions at the lowest operation frequency (88.1MHz), middle frequency (98.1MHz) and highest frequency ( 107.9MHz) were investigated. The worst case at 107.9MHz operation was recorded for final data.

## 5.4 Occupied Bandwidth

Emissions from the EUT shall be confined within a band 200 kHz wide centered on the operating frequency. The 200kHz band shall lie wholly within the frequency range of 88-108MHz.

In this case, maximum peak reading of the emissions for outside of 88-108MHz is under the limit in Section 15.209.

The GREEN limit lines in the plots are to demonstrate the compliance for frequency range outside 88-108MHz only. Within 88-108MHz, the BLACK limit lines and max. marker are used for demonstrating the compliance with the limit in 15.239(b), 48dBuV/m.
