

Operation Description

R/C Battle Tank

The R/C Battle Tank is powered by 3V battery. There are two-control stick on the EUT. When the forward or backward stick pushed once it will transmit a radio signal for receiver go forward or backward. When the turn left or turn right stick pushed once, it will transmit a radio signal for receiver go left or right

Refer to the transmitter circuit design, the circuit description is listed as below:

- ❑ IC1 and associate circuit act as encoder.
- ❑ XT1, Q1 and associate circuit act as oscillator.
- ❑ Q2 and associate circuit act as amplifier.
