2.2 Short description of the equipment under test (EUT)

The active timing system is used for time measurements in sport events and consists out of the RR02 (base station) and the RR01 (transponder). The RR02s 125 kHz loop antenna is placed on the time measurement position. The RR01 is mounted on the participant of the event or its equipment. The 125 kHz signal triggers a 2.4GHz transmission between the RR02 and the RR01. This message contains the required information and is stored.

For testing purposes of the 125 kHz function the RR01 was defined as TAG.

Number of tested samples: 1 Set (1x RR01, 1x RR02 and one AC/DC adapter)
 Serial number: none (RR02)
 AETUN02 (RR01)

2.3 Variants of the EUT

none

2.4 Operation frequency and channel plan

The operating frequency is 125 kHz.

2.5 EuT operation mode:

The equipment under test was operated during the measurement under the following conditions:

- 125kHz TX signal is active, 2.4GHz communication is active

2.6 Antenna

A wire is used as 125 kHz loop antenna. The length of the loop antenna is specified from 5m to 25m with a maximum loop width of 0.6m. 4mm connectors are used as plugs.

2.7 Power supply system utilised

Power supply voltage :
 RR02: 115 V / 60 Hz / 1 ϕ (AC/DC adapter) or
 5.0V DC (USB port) or
 4.0V DC (battery supplied)
 RR01: 3V DC (battery supplied)

2.8 Peripheral devices and interface cables

The following peripheral devices and interface cables are connected during the measurements:

- AC/DC power supply* Model : ETSA120150U, CUI Japan
 *part of EuT

4 TEST ENVIRONMENT

4.1 Address of the test laboratory

**CSA Group Bayern GmbH
Ohmstrasse 1-4
94342 STRASSKIRCHEN
GERMANY**

4.2 Environmental conditions

During the measurement the environmental conditions were within the listed ranges:

Temperature: 15-35 ° C

Humidity: 30-60 %

Atmospheric pressure: 86-106 kPa

4.3 Statement of the measurement uncertainty

The data and results referenced in this document are true and accurate. It is noted that the expanded measurement uncertainty corresponds to the measurement results from the standard measurement uncertainty multiplied by the coverage factor $k = 2$. The true value is located in the corresponding interval with a probability of 95 %. The measurement uncertainty was calculated for all measurements listed in this test report acc. to CISPR 16-4-2 / 11.2003 „Uncertainties, statistics and limit modelling – Uncertainty in EMC measurements“ and is documented in the quality system acc. to DIN EN ISO/IEC 17025. For all measurements shown in this report, the measurement uncertainty of the test laboratory, CSA Group Bayern GmbH, is below the measurement uncertainty as defined by CISPR. Therefore, no special measures must be taken into consideration with regard to the limits according to CISPR. Furthermore, component and process variability of devices similar to that tested may result in additional deviation. The manufacturer has the sole responsibility of continued compliance of the device.

4.4 Measurement protocol for FCC and IC

4.4.1 General information

4.4.1.1 Test methodology

Conducted and radiated disturbance testing is performed according to the procedures set out by the International Special Committee on Radio Interference (CISPR) Publication 22, European Standard EN 55022 as shown under section 1 of this report.

The Open Area test site is listed under the Canadian Test-Sites File-No:

IC 3009A-1

In compliance with RSS 210 testing for RSS compliance may be achieved by following the procedures set out in ANSI C63.10 and applying the CISPR 22 limits.

4.4.1.2 Justification

The equipment under test (EUT) is configured in a typical user arrangement in accordance with the manufacturer's instructions. A cable is connected to each available port and either terminated with a peripheral using the appropriate impedance characteristic or left unterminated. Where appropriate, cables are manually manipulated with respect to each other thus obtaining maximum disturbances from the unit.

4.4.1.3 Details of test procedures

The test methods used comply with CISPR Publication 22, EN 55022 - "Information technology equipment - Radio disturbance characteristics - Limits and methods of measurement" and with ANSI C63.4 - "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". In compliance with 47 CFR Part 15 Subpart A, Section 15.38 testing for FCC compliance may be achieved by following the procedures set out in ANSI C63.10 and applying the CISPR 22 limits.

5 TEST CONDITIONS AND RESULTS

5.1 AC power line conducted emissions

For test instruments and accessories used see section 6 Part A 4.

5.1.1 Description of the test location

Test location: Shielded Room S2

5.1.2 Photo documentation of the test set-up

5.1.3 Applicable standard

According to FCC Part 15, Section 15.207 and RSS-Gen 8.8

5.1.4 Description of Measurement

The measurements are performed according the procedures set out in ANSI C63.10

5.1.5 Test result

Frequency range: 0.15 MHz - 30 MHz

Min. limit margin 4.19 dB at 0.3945 MHz

Limit according to FCC Part 15, Section 15.207(a) and RSS Gen 8.8 Table 3:

Frequency of Emission (MHz)	Conducted Limit (dBμV)	
	Quasi-peak	Average
0.15-0.5	66 to 56 *	56 to 46 *
0.5-5	56	46
5-30	60	50

* Decreases with the logarithm of the frequency

The requirements are **FULFILLED**.

Remarks: Pretests indicates that shorter loop antenna length leads to higher emission results. To create
a worst case scenario a loop antenna length of 2m was used even though the specification lists a
minimum length of 5m. The measurement was made at the AC input of the dedicated AC/DC
power adapter.

5.2.2 Description of Measurement

The measurements are performed following the procedures set out in ANSI C63.10.

The resolution bandwidth during the measurement is as follows:

9 kHz – 150 kHz: RBW: 200 Hz
150 kHz – 30 MHz: RBW: 9 kHz

5.2.3 Test result

The measurement value is calculated from a distance of 3 m to 300 m by subtracting the factor 40 dB/decade.
