

1. Our product can receive normal FM broadcast signal. The normal broadcasting station can not only be allowed to broadcast normal phonetic and musical voices, but the negative carrier named as SCA (Subsidiary Communications Authorization) contained in the broadcast signal is also permitted by FCC. The function of our product is that it can convert the SCA signal to normal FM signal and then send it out. Thus it can make ordinary FM car radio receive this signal.
2. If our product cannot receive SCA broadcast signal, the transmitter will stop transmitting.
