EMC TEST REPORT For FCC

Test Report No. : 2006060039
Date of Issue : June 28, 2006
FCC ID : T5ISNA-260AA
Model/Type No. : SNA-260AA, SN-260AB, SNA-260AB, SN-260CA, SN-260CB, SN-260BB, SN-260BA, SN-260DA, SN-260DB and IV100
Kind of Product : Digital Satellite Receiver
Applicant : Tcom Technology Co., Ltd.
Applicant Address : 602, Chungjuk tower 546-9, Sang2-dong, Wonmi-gu, Bucheon-si, Gyeonggi-do, Korea
Manufacturer : Tcom Technology Co., Ltd.
Manufacturer Address : 602, Chungjuk tower 546-9, Sang2-dong, Wonmi-gu, Bucheon-si, Gyeonggi-do, Korea
Contact Person : Young-Gyu Kim / Assistant Research Engineer
Telephone : + 82-32-326-4842
Received Date : June 8, 2006
Test period : Start : June 20, 2006 End : June 26, 2006
Test Results : ☒ **In Compliance** ☐ **Not in Compliance**

The test results presented in this report relate only to the object tested.

CTK Co., Ltd. is accredited by Korea Laboratory Accreditation Scheme (KOLAS) which signed the International Laboratory Accreditation Cooperation (ILAC) Mutual Recognition Arrangement (MRA) for the above test item(s) and test method(s).

1.7 Calibration Details of Equipment Used for Measurement

Test equipment and test accessories are calibrated on regular basis. The maximum time between calibrations is one year or what is recommended by the manufacturer, whichever is less. All test equipment calibrations are traceable to the Korea Research Institute of Standards and Science (KRISS), therefore, all test data recorded in this report is traceable to KRISS.

1.8 Test Facility

The measurement facility is located at 386-1, Ho-dong, Cheoin-gu, Yongin-si, Gyeonggi-do, 449-100, Korea. The sites are constructed in conformance with the requirements of ANSI C63.7, ANSI C63.4.

1.9 Measurement Procedure

Preliminary AC power line conducted emissions tests were performed shielded room. To find worst mode, several typical mode and typical cable position were tested. Final AC power line conducted emissions test was performed shielded room. (location is same as Preliminary test)
Based on the preliminary tests of the EUT, final test was proceeded worst case test mode and cable configuration.

Preliminary radiated emissions test were performed anechoic chamber (Distance of antenna and EUT was 3 m). To find worst mode, several typical mode and typical cable position were tested and peak level and frequency were recorded.

Final radiated emissions test was performed Open Area Test Site. Based on the preliminary tests of the EUT, final test was proceeded worst case test mode and cable configuration.

* Measurement procedures was In accordance with ANSI C63.4-2003 7.2.3, 7.2.4, 8.3.1.1, 8.3.1.2

Test Procedures

The EUT was placed on a non-metallic table 0.8m above the metallic, grounded floor and 0.4m from the reference ground plane wall. The distance to other metallic surfaces was at least 0.8m.

Amplitude measurements were performed with a quasi-peak detector and an average detector.

Test was performed in Analog signal receiving mode and Satellite signal receiving mode.

The emission of Satellite signal receiving mode was higher, only the test results of Satellite signal receiving mode is listed in Appendix A.

Test Procedures

The height of the measuring antenna was varied between 1 to 4 m and the table was rotated a full revolution in order to obtain maximum values of the electric field intensity. The measurement was made in both the vertical and horizontal polarization, and the maximum value is presented in the report.

Measurements were performed with a quasi-peak detector.

Instrument Settings

IF Band Width: 100 kHz (30 to 1000 MHz)

IF Band Width: 1 MHz (Above 1000 MHz)

Test Procedures

Antenna-conducted power measurements are performed with the EUT antenna terminals connected directly to a spectrum analyzer, if the antenna impedance matches the impedance of the measuring instrument. Otherwise, use an impedance-matching network to connect the measuring instrument to the antenna terminals of the EUT. Losses in decibels in any impedance matching network used are added to the measured value in dBuV.

With the EUT tuned to one of the number of frequencies, measure both the frequency and voltage present at the antenna input terminals over the frequency range specified in the individual equipment requirements. Repeat this measurement with the EUT tuned to another frequency until the number of frequencies have been successively measured.

Power available from the EUT antenna terminals is the ratio of V^2/R , where V is the loss-corrected voltage measured at the antenna terminals, and R is the impedance of the measuring instrument.

Test Results

The requirements are:

- ☒ MET
☐ NOT MET

Remarks

No values due to local oscillator higher than 20dB below the limits was measured during the disturbance voltage at the antenna terminals.
Emissions 20dB's below the limit were not necessarily recorded.

Instrument Settings

IF Band Width: 100 kHz (30 to 1000 MHz)

IF Band Width: 1 MHz (Above 1000 MHz)

Test Procedures

The Output signal level is the maximum voltage level present at the output terminals of the EUT on a particular frequency during normal use of the device.

Measurements were made by direct connection to the spectrum analyzer and EUT with proper impedance matching.

The Cable was supported between the EUT and the measuring instrument in a straight horizontal line so it had at least 75 cm clearance from any conducting surface.

The EUT was provided with a typical signal consistent with normal operation. For each channel on which the device operates and in each mode in which the device operates, the video carrier level, audio carrier level and the spurious emissions over the frequency range was measured and recorded.

Test Procedures

Isolation was measured for all positions of an antenna transfer switch on all output channels of the EUT. All unused RF ports or terminals was terminated in a proper impedance. TV interface device transfer switch isolation is the difference the levels of a signal going into one antenna input port of the switch and that of the same signal coming out of another antenna input port of the transfer switch. The isolation of an antenna transfer switch equipped with coaxial connectors was performed by measuring the maximum voltage of the visual carrier. The maximum voltage corresponds to the peak envelope power of a modulated signal during maximum amplitude peaks. Using an impedance-matching device, the length of coaxial cable was connected between the antenna terminal of the switch and the measuring instrument. The measuring instrument was tuned to the output channel of the EUT in peak mode. The voltage level present at the antenna input port of the EUT and the output channel of the EUT was measured and recorded
