

Model: Transmitter of BB COMFORT F5 circuit description

After putting in batteries, CPU S3P72N4 would check whether the battery level is low. If the battery level is low it would send a signal via transmitting circuitry CC2550 to display terminal(receiver) for indicating battery low. Otherwise CPU would analyze the weight data signal that measure by load cell(sensor_system_1) and amplify by operating amplifier (Mod_Weight) when a weight or human putting on this scale base unit. The CPU would also detect zero weight, if the weight were zero the scale base unit would be turned off and enter sleep mode after the zero weight detected for a while. If the detected weight is not zero, CPU would wait and ask transmitter board to send data if the weight come to stable. Via the BIA circuitry(Imptst01) the data about proportion of body fat, water in the body and muscle would be detected and sent to display terminal (receiver).

CC2550

Single Chip Low Cost Low Power RF-Transmitter

Applications

- 2400-2483.5MHz ISM/SRD band systems
- Wireless game controllers
- Wireless audio
- Consumer Electronics

Product Description

The **CC2550** is a low cost true single chip 2.4GHz transmitter designed for very low power wireless applications. The circuit is intended for the ISM (Industrial, Scientific and Medical) and SRD (Short Range Device) frequency band at 2400MHz-2483.5MHz.

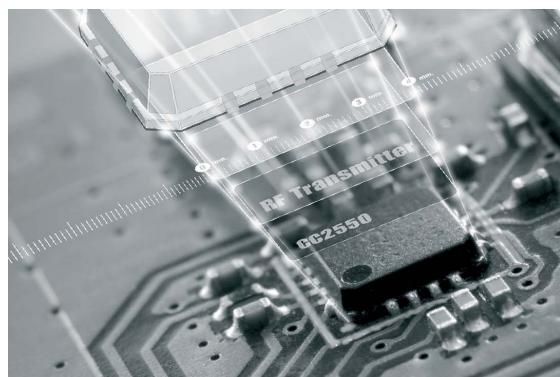

The RF transmitter is integrated with a highly configurable baseband modulator which has a configurable data rate up to 500kbps. Performance can be increased by enabling a Forward Error Correction option, which is integrated in the modulator.

The **CC2550** provides extensive hardware support for packet handling, data buffering and burst transmissions.

The main operating parameters and the 64-byte transmit FIFO of **CC2550** can be controlled via an SPI interface. In a typical system, the

CC2550 will be used together with a microcontroller and a few passive components.

CC2550 is based on Chipcon's SmartRF®04 technology in 0.18µm CMOS.

Key Features

- Small size (QLP 4x4mm package, 16 pins)
- True single chip 2.4GHz RF transmitter
- Frequency range: 2400MHz-2483.5MHz
- Programmable data rate up to 500kbps
- Low current consumption
- Programmable output power up to +1dBm
- Very few external components: Totally on-chip frequency synthesizer, no external filters needed
- Programmable baseband modulator
- Ideal for multi-channel operation
- Configurable packet handling hardware
- Suitable for frequency hopping systems due to a fast settling frequency synthesizer
- Optional Forward Error Correction with interleaving
- 64-byte TX data FIFO
- Suited for systems compliant with EN 300 328 and EN 300 440 class 2 (Europe),

CFR47 Part 15 (US), and ARIB STD-T66 (Japan)

- Many powerful digital features allow a high-performance RF system to be made using an inexpensive microcontroller
- Efficient SPI interface: All registers can be programmed with one "burst" transfer
- Integrated analog temperature sensor
- Lead-free "green" package
- Flexible support for packet oriented systems: On chip support for sync word insertion, flexible packet length and automatic CRC handling
- OOK and flexible ASK shaping supported
- 2-FSK and MSK supported.
- Optional automatic whitening of data
- Support for asynchronous transparent transmit mode for backwards compatibility with existing radio communication protocols

1 Abbreviations

Abbreviations used in this data sheet are described below.

2-FSK	Binary Frequency Shift Keying	PD	Power Down
ADC	Analog to Digital Converter	PLL	Phase Locked Loop
AFC	Automatic Frequency Offset Compensation	PQI	Preamble Quality Indicator
AGC	Automatic Gain Control	QPSK	Quadrature Phase Shift Keying
AMR	Automatic Meter Reading	RF	Radio Frequency
ASK	Amplitude Shift Keying	RSSI	Received Signal Strength Indicator
CRC	Cyclic Redundancy Check	RX	Receive, Receive Mode
ESR	Equivalent Series Resistance	SNR	Signal to Noise Ratio
FEC	Forward Error Correction	SPI	Serial Peripheral Interface
FSK	Frequency Shift Keying	TBD	To Be Defined
IF	Intermediate Frequency	TX	Transmit, Transmit Mode
LNA	Low Noise Amplifier	VCO	Voltage Controlled Oscillator
LQI	Link Quality Indicator	WOR	Wake on Radio, Low power polling
MCU	Microcontroller unit	XOSC	Crystal Oscillator
MSK	Minimum Shift Keying	XTAL	Crystal
PA	Power Amplifier		

2 Absolute Maximum Ratings

Under no circumstances must the absolute maximum ratings given in Table 1 be violated. Stress exceeding one or more of the limiting values may cause permanent damage to the device.

Caution! ESD sensitive device.
Precaution should be used when handling
the device in order to prevent permanent
damage.

Parameter	Min	Max	Units	Condition
Supply voltage	-0.3	3.6	V	All supply pins must have the same voltage
Voltage on any digital pin	-0.3	VDD+0.3, max 3.6	V	
Voltage on the pins RF_P, RF_N and DCOUPL	-0.3	2.0	V	
Input RF level		TBD	dBm	
Storage temperature range	-50	150	°C	
Solder reflow temperature		260	°C	T = 10 s
ESD		2	kV	All pads (excluding RF) have 2kV HBM ESD protection

Table 1: Absolute Maximum Ratings

3 Operating Conditions

The operating conditions for **CC2550** are listed Table 2 in below.

Parameter	Min	Max	Unit	Condition
Operating temperature	-40	85	°C	
Operating supply voltage	1.8	3.6	V	All supply pins must have the same voltage

Table 2: Operating Conditions

4 Electrical Specifications

Tc = 25°C, VDD = 3.0V if nothing else stated. Measured on Chipcon's **CC2550** EM reference design.

Parameter	Min	Typ	Max	Unit	Condition
Current consumption		1.2		mA	Only voltage regulator to digital part and crystal oscillator running (IDLE state)
		6.8		mA	Only the frequency synthesizer running (after going from IDLE until reaching TX state, and frequency calibration states)
		12.8		mA	Transmit mode, -12dBm output power (TX state)
		16.4		mA	Transmit mode, -6dBm output power (TX state)
		22.8		mA	Transmit mode, 0dBm output power (TX state)
Current consumption in power down modes		180		µA	Voltage regulator to digital part on, all other modules in power down (XOFF state)
		200		nA	Voltage regulator to digital part off (SLEEP state)

Table 3: Electrical Specifications

5 General Characteristics

Parameter	Min	Typ	Max	Unit	Condition/Note
Frequency range	2400		2483.5	MHz	
Data rate	1.2		500	kbps	Modulation formats supported: (Shaped) MSK (differential offset QPSK, up to 500kbps) 2-FSK (up to 250kbps) OOK/ASK (up to 250kbps) Optional Manchester encoding (halves the data rate).

Table 4: General Characteristics

6 RF Transmit Section

T_c = 25°C, VDD = 3.0V if nothing else stated. Measured on Chipcon's **CC2550** EM reference design.

Parameter	Min	Typ	Max	Unit	Condition/Note
Differential load impedance		200		Ω	Optimised for matching to both 50Ω single-ended load and PCB antennas with higher impedance.
Output power, highest setting		1		dBm	Output power is programmable. Delivered to 50Ω single-ended load via Chipcon reference RF matching network.
Output power, lowest setting		-30		dBm	Output power is programmable. Delivered to 50Ω single-ended load via Chipcon reference RF matching network.
Adjacent channel power		-26		dBc	The given values are for 1MHz channel spacing (±1MHz from carrier) and 500kbps MSK.
Alternate channel power		-46		dBc	The given values are for 1MHz channel spacing (±2MHz from carrier) and 500kbps MSK.
Spurious emissions			-36 -54 -47 -41 -30	dBm	25MHz – 1GHz 47-74, 87.5-118, 174-230, 470-862MHz 1800MHz-1900MHz (restricted band in Europe) At 2·RF and 3·RF (restricted bands in USA) Otherwise above 1GHz

Table 5: RF Transmit Parameters

7 Crystal Oscillator

Tc = 25°C @ VDD = 3.0V if nothing else is stated.

Parameter	Min	Typ	Max	Unit	Condition/Note
Crystal frequency	26	26	28	MHz	
Tolerance		±40		ppm	<p>This is the total tolerance including a) initial tolerance, b) ageing and c) temperature dependence.</p> <p>The acceptable crystal tolerance depends on RF frequency and channel spacing / bandwidth.</p>
ESR			100	Ω	
C ₀			TBD	pF	
C _L	TBD		TBD	pF	
Start-up time		300		μs	Measured on Chipcon's CC2550 EM reference design.

Table 6:Crystal Oscillator Parameters

8 Frequency Synthesizer Characteristics

Tc = 25°C @ VDD = 3.0V if nothing else is stated. Measured on Chipcon's **CC2550** EM reference design.

Parameter	Min	Typ	Max	Unit	Condition/Note
Programmed frequency resolution	397	$F_{XOSC}/2^{16}$	427	Hz	26MHz-28MHz crystal.
Synthesizer frequency tolerance		±40		ppm	Given by crystal used. Required accuracy (including temperature and aging) depends on frequency band and channel bandwidth / spacing.
RF carrier phase noise		-72		dBc/Hz	@ 50kHz offset from carrier
RF carrier phase noise		-72		dBc/Hz	@ 100kHz offset from carrier
RF carrier phase noise		-73		dBc/Hz	@ 200kHz offset from carrier
RF carrier phase noise		-95		dBc/Hz	@ 1MHz offset from carrier
RF carrier phase noise		-106		dBc/Hz	@ 2MHz offset from carrier
RF carrier phase noise		-114		dBc/Hz	@ 5MHz offset from carrier
RF carrier phase noise		-117		dBc/Hz	@ 10MHz offset from carrier
PLL turn-on / hop time			80	μs	Time from leaving the IDLE state until arriving in the FSTXON or TX state, when not performing calibration. Crystal oscillator running.
PLL calibration time	0.67	18739		XOSC cycles	Calibration can be initiated manually, or automatically before entering or after leaving RX/TX.
		0.72	0.72	ms	Min/typ/max time is for 28/26/26MHz crystal frequency.

Table 7: Frequency Synthesizer Parameters

9 Analog temperature sensor

The characteristics of the analog temperature sensor are listed in Table 8 below. Note that it is necessary to write 0xBF to the PTEST register to use the analog temperature sensor in the IDLE state.

The values in the table are simulated results and will be updated in later versions of the data sheet. Minimum / maximum values are valid over entire supply voltage range. Typical values are for 3.0V supply voltage.

Parameter	Min	Typ	Max	Unit	Condition/Note
Output voltage at -40°C	0.638	0.648	0.706	V	
Output voltage at 0°C	0.733	0.743	0.793	V	
Output voltage at +40°C	0.828	0.840	0.891	V	
Output voltage at +80°C	0.924	0.939	0.992	V	
Output voltage at +120°C	1.022	1.039	1.093	V	
Temperature coefficient	2.35	2.45	2.46	mV/°C	Fitted from -20°C to +80°C
Absolute error in calculated temperature	-14	-8	+14	°C	From -20°C to +80°C when assuming best fit for absolute accuracy: 0.763V at 0°C and 2.44mV / °C
Error in calculated temperature, calibrated	-2		+2	°C	From -20°C to +80°C when using 2.44mV / °C, after 1-point calibration at room temperature
Settling time after enabling		TBD		μs	
Current consumption increase when enabled		0.3		mA	

Table 8: Analog Temperature Sensor Parameters

10 DC Characteristics

The DC Characteristics of **CC2550** are listed in Table 9 below.

T_c = 25°C if nothing else stated.

Digital Inputs/Outputs	Min	Max	Unit	Condition
Logic "0" input voltage	0	0.7	V	
Logic "1" input voltage	VDD-0.7	VDD	V	
Logic "0" output voltage	0	0.5	V	For up to 4mA output current
Logic "1" output voltage	VDD-0.3	VDD	V	For up to 4mA output current
Logic "0" input current	N/A	-1	μA	Input equals 0V
Logic "1" input current	N/A	1	μA	Input equals VDD

Table 9: DC Characteristics

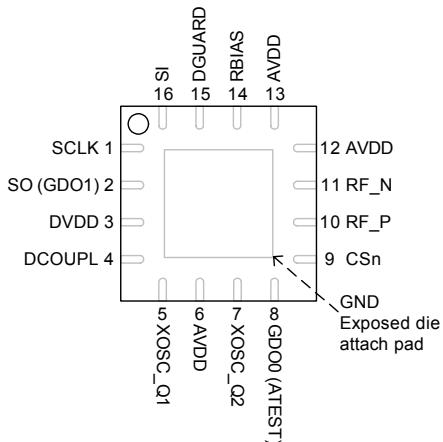

11 Power On Reset

When the power supply complies with the requirements in Table 10 below, proper Power-On-Reset functionality is guaranteed. Otherwise, the chip should be assumed to have unknown state until transmitting an SRES strobe over the SPI interface. It is recommended to transmit an SRES strobe after turning power on in any case. See section 23.1 on page 22 for a description of the recommended start up sequence after turning power on.

Parameter	Min	Typ	Max	Unit	Condition/Note
Power-up ramp-up time.			5	ms	From 0V until reaching 1.8V
Power off time	1			ms	Minimum time between power off and power-on.

Table 10: Power-on Reset Requirements

12 Pin Configuration

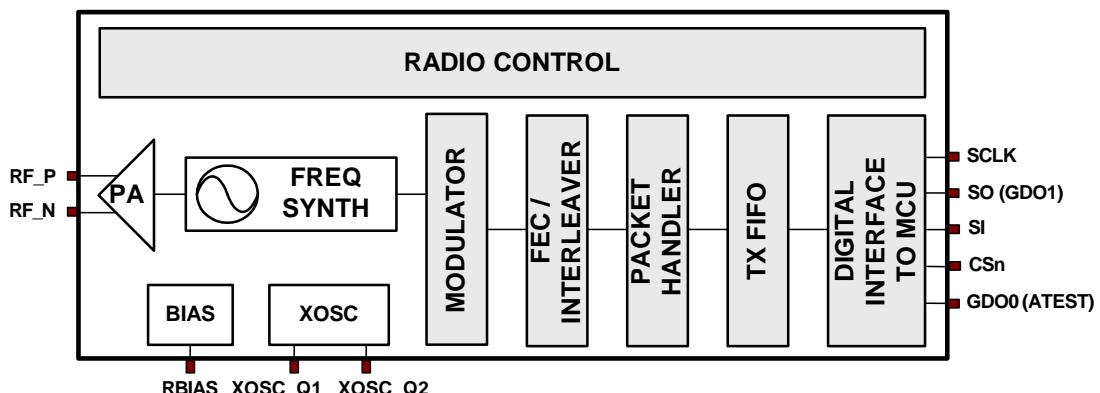

Figure 1: Pinout top view

Note: The exposed die attach pad **must** be connected to a solid ground plane as this is the main ground connection for the chip.

Pin #	Pin name	Pin type	Description
1	SCLK	Digital Input	Serial configuration interface, clock input
2	SO (GDO1)	Digital Output	Serial configuration interface, data output. Optional general output pin when CSn is high
3	DVDD	Power (Digital)	1.8V-3.6V digital power supply for digital I/O's and for the digital core voltage regulator
4	DCOUPL	Power (Digital)	1.6V-2.0V digital power supply output for decoupling. NOTE: This pin is intended for use with the CC2550 only. It cannot be used to provide supply voltage to other devices.
5	XOSC_Q1	Analog I/O	Crystal oscillator pin 1, or external clock input
6	AVDD	Power (Analog)	1.8V-3.6V analog power supply connection
7	XOSC_Q2	Analog I/O	Crystal oscillator pin 2
8	GDO0 (ATEST)	Digital I/O	Digital output pin for general use: <ul style="list-style-type: none"> • Test signals • FIFO status signals • Clock output, down-divided from XOSC • Serial input TX data Also used as analog test I/O for prototype/production testing
9	CSn	Digital Input	Serial configuration interface, chip select
10	RF_P	RF I/O	Positive RF output signal from PA
11	RF_N	RF I/O	Negative RF output signal from PA
12	AVDD	Power (Analog)	1.8V-3.6V analog power supply connection
13	AVDD	Power (Analog)	1.8V-3.6V analog power supply connection
14	RBIAS	Analog I/O	External bias resistor for reference current
15	DGUARD	Power (Digital)	Power supply connection for digital noise isolation
16	SI	Digital Input	Serial configuration interface, data input

Table 11: Pinout overview

13 Circuit Description

Figure 2: CC2550 Simplified Block Diagram

A simplified block diagram of **CC2550** is shown in Figure 2.

The **CC2550** transmitter is based on direct

synthesis of the RF frequency. The frequency synthesizer includes a completely on-chip LC VCO.

A crystal is to be connected to XOSC_Q1 and XOSC_Q2. The crystal oscillator generates the reference frequency for the synthesizer, as well as clocks for the digital part.

A 4-wire SPI serial interface is used for

configuration and data buffer access.

The digital baseband includes support for channel configuration, packet handling and data buffering.

14 Application Circuit

Only a few external components are required for using the **CC2550**. The recommended application circuit is shown in Figure 3. The external components are described in Table 12, and typical values are given in Table 13. Note that the PCB antenna alternative indicated in Figure 3 is preliminary and subject to changes. Performance for the PCB antenna alternative will be included in future revisions of this data sheet.

Bias resistor

The bias resistor R141 is used to set an accurate bias current.

Balun and RF matching

C102, C112, L101 and L111 form a balun that converts the differential RF port on **CC2550** to a single-ended RF signal (C101 and C111 are also needed for DC blocking). Together with an appropriate LC network, the balun

components also transform the impedance to match a 50Ω antenna (or cable). Component values for the RF balun and LC network are easily found using the SmartRF® Studio software. Suggested values are listed in Table 13.

Crystal

The crystal oscillator uses an external crystal with two loading capacitors (C51 and C71). See section 29 on page 26 for details.

Power supply decoupling

The power supply must be properly decoupled close to the supply pins. Note that decoupling capacitors are not shown in the application circuit. The placement and the size of the decoupling capacitors are very important to achieve the optimum performance. Chipcon provides a reference design that should be followed closely.

Component	Description
C41	100nF decoupling capacitor for on-chip voltage regulator to digital part
C51/C71	Crystal loading capacitors, see section 29 on page 26 for details
C101/C111	RF balun DC blocking capacitors
C102/C112	RF balun/matching capacitors
C103/C104	RF LC filter/matching capacitors
L101/L111	RF balun/matching inductors (inexpensive multi-layer type)
L102	RF LC filter inductor (inexpensive multi-layer type)
R141	56k Ω resistor for internal bias current reference
XTAL	26MHz-28MHz crystal, see section 29 on page 26 for details

Table 12: Overview of external components (excluding supply decoupling capacitors)

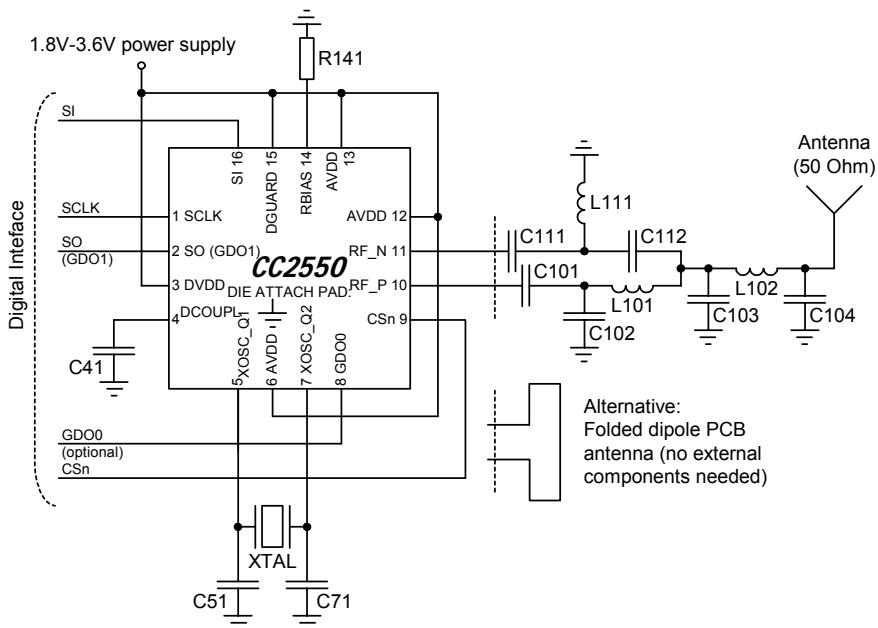

Figure 3: Typical application and evaluation circuit (power supply decoupling not shown)

Component	Value
C41	100nF±10%, 0402 X5R
C51	27pF±5%, 0402 NP0
C71	27pF±5%, 0402 NP0
C101	100pF±5%, 0402 NP0
C102	1.0pF±0.25pF, 0402 NP0
C103	1.8pF±0.25pF, 0402 NP0
C104	1.5pF±0.25pF, 0402 NP0
C111	100pF±5%, 0402 NP0
C112	1.0pF±0.25pF, 0402 NP0
L101	1.2nH±0.3nH, 0402 monolithic
L102	1.2nH±0.3nH, 0402 monolithic
L111	1.2nH±0.3nH, 0402 monolithic
R141	56kΩ±1%, 0402
XTAL	26.0MHz surface mount crystal

Table 13: Bill Of Materials for the application circuit (subject to changes)

15 Configuration Overview

CC2550 can be configured to achieve optimum performance for many different applications. Configuration is done using the SPI interface. The following key parameters can be programmed:

- Power-down / power up mode
- Crystal oscillator power-up / power – down
- Transmit mode

- RF channel selection
- Data rate
- Modulation format
- RF output power
- Data buffering with 64-byte transmit FIFO
- Packet radio hardware support
- Forward Error Correction with interleaving
- Data Whitening

Details of each configuration register can be found in section 33, starting on page 29.

Figure 4 shows a simplified state diagram that explains the main **CC2550** states, together with

typical usage and current consumption. For detailed information on controlling the **CC2550** state machine, and a complete state diagram, see section 23, starting on page 21.

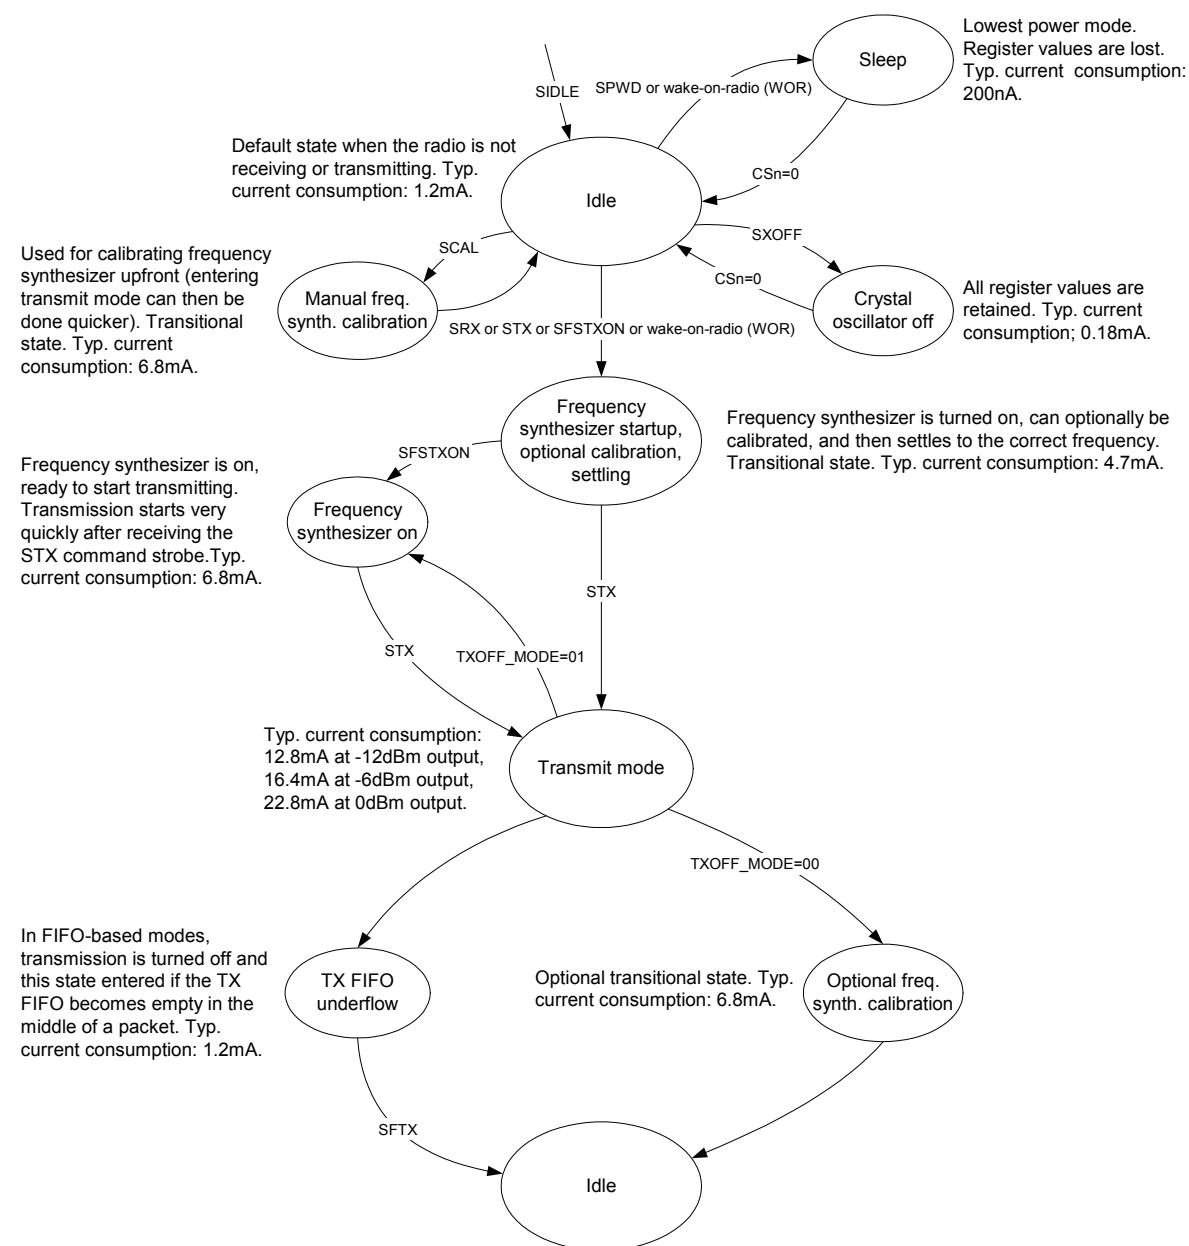

Figure 4: Simplified state diagram, with typical usage and current consumption

16 Configuration Software

CC2550 can be configured using the SmartRF® Studio software, available for download from <http://www.chipcon.com>. The SmartRF® Studio software is highly recommended for obtaining

optimum register settings, and for evaluating performance and functionality. A screenshot of the SmartRF® Studio user interface for **CC2550** is shown in Figure 5.

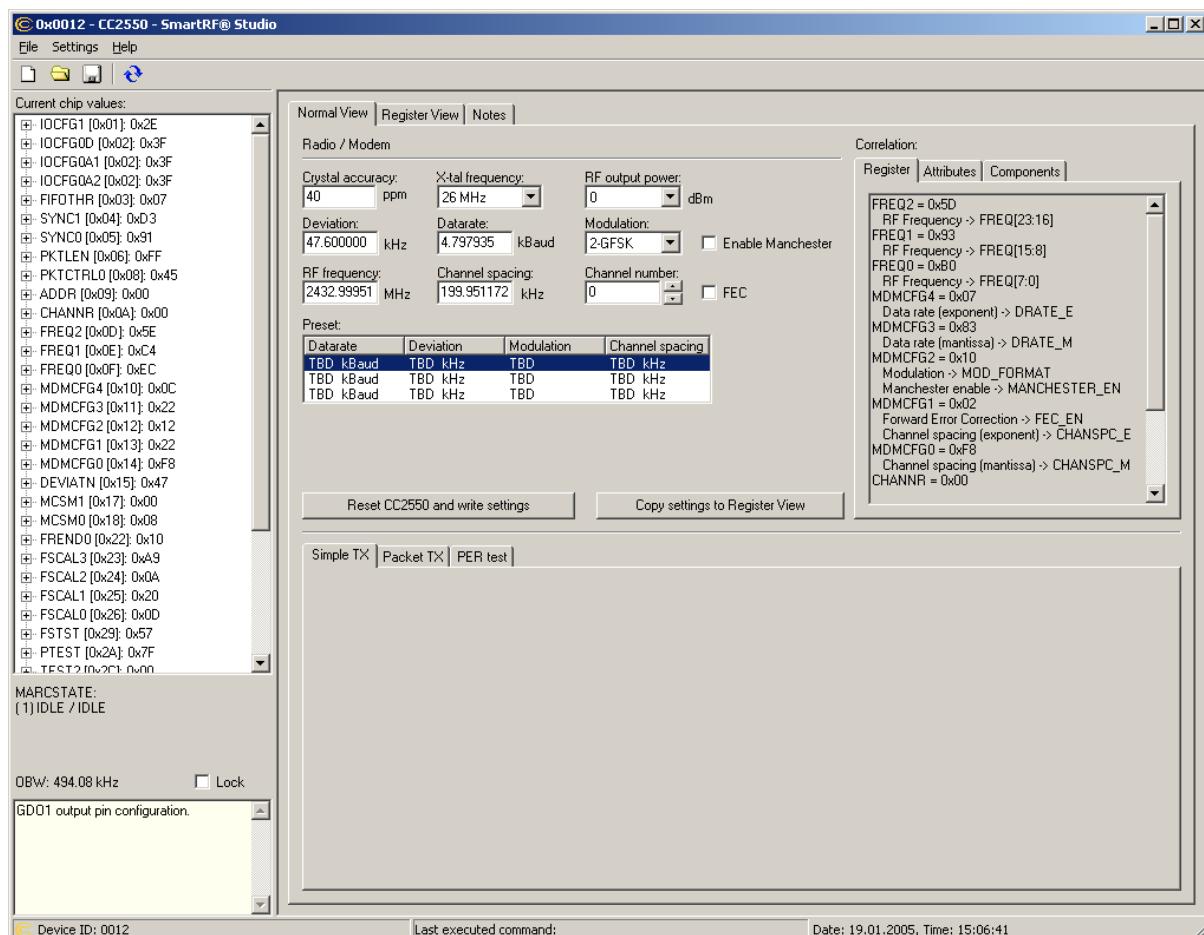

Figure 5: SmartRF® Studio user interface

17 4-wire Serial Configuration and Data Interface

CC2550 is configured via a simple 4-wire SPI-compatible interface (SI, SO, SCLK and CS_n) where **CC2550** is the slave. This interface is also used to read and write buffered data. All address and data transfer on the SPI interface is done most significant bit first.

All transactions on the SPI interface start with a header byte containing a read/write bit, a burst access bit and a 6-bit address.

During address and data transfer, the CS_n pin (Chip Select, active low) must be kept low. If CS_n goes high during the access, the transfer will be cancelled.

When CS_n goes low, the MCU must wait until the SO pin from **CC2550** goes low before starting to transfer the header byte. This indicates that the voltage regulator has stabilized and the crystal is running. Unless the chip was in the SLEEP or XOFF states, the

SO pin will always go low immediately after taking CS_n low.

17.1 Chip Status Byte

When the header byte is sent on the SPI interface, the chip status byte is sent by the **CC2550** on the SO pin. The status byte contains key status signals, useful for the MCU. The first bit, s7, is the CHIP_RDY_n signal; this signal must go low before the first positive edge of SCLK. The CHIP_RDY_n signal indicates that the crystal is running and the regulated digital supply voltage is stable.

Bit 6, 5 and 4 comprises the STATE value. This value reflects the state of the chip. When idle the XOSC and power to the digital core is on, but all other modules are in power down. The frequency and channel configuration should only be updated when the chip is in this state.

The TX state will be active when the chip is in transmit mode.

The last four bits (3:0) in the status byte contains `FIFO_BYTES_AVAILABLE`. This field contains the number of bytes free for writing into the TX FIFO. When `FIFO_BYTES_AVAILABLE=15`, 15 or more bytes are free.

17.2 Registers Access

The configuration registers on the **CC2550** are located on SPI addresses from 0x00 to 0x2F. Table 23 on page 31 lists all configuration registers. The detailed description of each register is found in Section 33.1, starting on page 33. All configuration registers can be both written and read. The read/write bit controls if the register should be written or read. When writing to registers, the status byte is sent on the `SO` pin each time a data byte to be written is transmitted on the `SI` pin.

Registers with consecutive addresses can be accessed in an efficient way by setting the burst bit in the address header. The address sets the start address in an internal address counter. This counter is incremented by one each new byte (every 8 clock pulses). The burst access is either a read or a write access and must be terminated by setting `CSn` high.

For register addresses in the range 0x30-0x3D, the “burst” bit is used to select between status registers and command strobes (see below). The status registers can only be read. Burst read is not available for status registers, so they must be read one at a time.

17.3 Command Strobes

Command Strobes may be viewed as single byte instructions to **CC2550**. By addressing a Command Strobe register, internal sequences will be started. These commands are used to disable the crystal oscillator, enable transmit mode, flush the TX FIFO etc. The nine command strobes are listed in Table 22 on page 30.

The command strobe registers are accessed in the same way as for a register write operation, but no data is transferred. That is, only the R/W bit (set to 0), burst access (set to 0) and the six address bits (in the range 0x30 through 0x3D) are written. A command strobe may be followed by any other SPI access

without pulling `CSn` high. The command strobes are executed immediately, with the exception of the `SPWD` and the `SXOFF` strobes that are executed when `CSn` goes high.

17.4 FIFO Access

The 64-byte TX FIFO is accessed through the 0x3F address. When the read/write bit is zero, the TX FIFO is accessed. The TX FIFO is write-only.

The burst bit is used to determine if FIFO access is single byte or a burst access. The single byte access method expects address with burst bit set to zero and one data byte. After the data byte a new address is expected; hence, `CSn` can remain low. The burst access method expects one address byte and then consecutive data bytes until terminating the access by setting `CSn` high.

The following header bytes access the FIFO:

- 0x3F: Single byte access to TX FIFO
- 0x7F: Burst access to TX FIFO

When writing to the TX FIFO, the status byte (see Section 17.1) is output for each new data byte on `SO`, as shown in Figure 6. This status byte can be used to detect TX FIFO underflow while writing data to the TX FIFO. Note that the status byte contains the number of bytes free *before* writing the byte in progress to the TX FIFO. When the last byte that fits in the TX FIFO is transmitted to the `SI` pin, the status byte received concurrently on the `SO` pin will indicate that one byte is free in the TX FIFO.

The transmit FIFO may be flushed by issuing a `SFTX` command strobe. The FIFO is cleared when going to the SLEEP state.

17.5 PATABL E Access

The 0x3E address is used to access the PATABL E, which is used for selecting PA power control settings. The SPI expects up to eight data bytes after receiving the address. By programming the PATABL E, controlled PA power ramp-up and ramp-down can be achieved, as well as ASK modulation shaping for reduced bandwidth. See section 28 on page 25 for output power programming details.

The PATABL E is an 8-byte table that defines the PA control settings to use for each of the eight PA power values (selected by the 3-bit

value `FREND0.PA_POWER`). The table is written and read from the lowest setting (0) to the highest (7), one byte at a time. An index counter is used to control the access to the table. This counter is incremented each time a byte is read or written to the table, and set to the lowest index when `CSn` is high. When the highest value is reached the counter restarts at zero.

The access to the `PATABLE` is either single byte or burst access depending on the burst bit. When using burst access the index counter

will count up; when reaching 7 the counter will restart at 0. The read/write bit controls whether the access is a write access (`R/W=0`) or a read access (`R/W=1`).

If one byte is written to the `PATABLE` and this value is to be read out then `CSn` must be set high before the read access in order to set the index counter back to zero.

Note that the content of the `PATABLE` is lost when entering the SLEEP state.

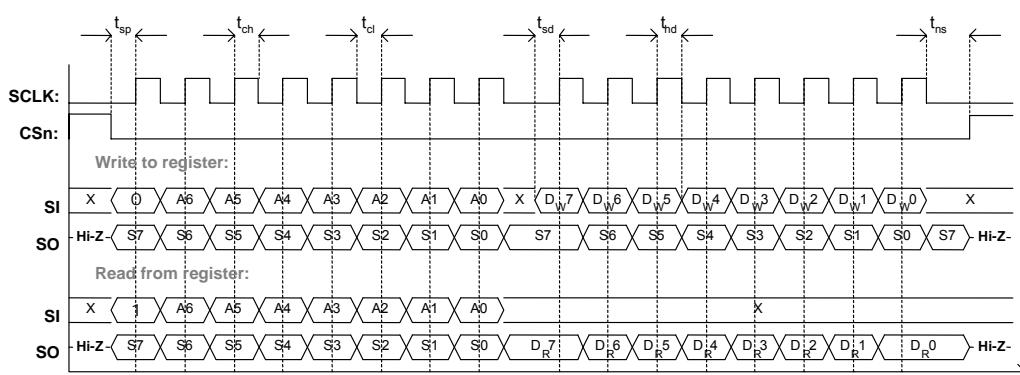

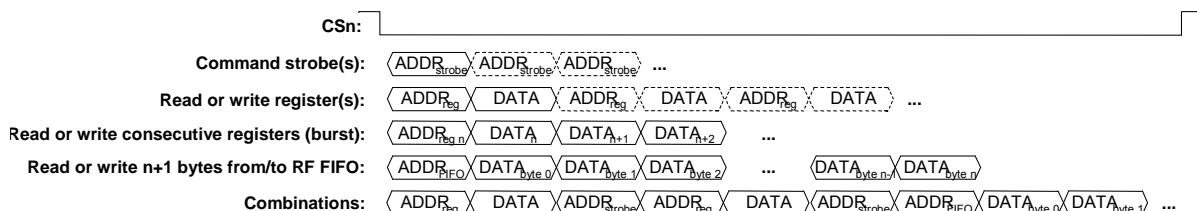

Figure 6: Configuration registers write and read operations

Parameter	Description	Min	Max
F_{SCLK}	SCLK frequency	0	10MHz
$t_{sp, pd}$	CSn low to positive edge on SCLK, in power-down mode	TBD μ s	-
t_{sp}	CSn low to positive edge on SCLK, in active mode	TBDns	-
t_{ch}	Clock high	50ns	-
t_{cl}	Clock low	50ns	-
t_{rise}	Clock rise time	-	TBDns
t_{fall}	Clock fall time	-	TBDns
t_{sd}	Setup data to positive edge on SCLK	TBDns	-
t_{hd}	Hold data after positive edge on SCLK	TBDns	-
t_{ns}	Negative edge on SCLK to CSn high.	TBDns	-

Table 14: SPI interface timing requirements

Bits	Name	Description		
7	CHIP_RDYn	Stays high until power and crystal have stabilized. Should always be low when using the SPI interface.		
6:4	STATE[2:0]	Indicates the current main state machine mode		
		Value	State	Description
		000	Idle	IDLE state (Also reported for some transitional states instead of SETTLING or CALIBRATE, due to a small error)
		001	Not used (RX)	Not used, included for software compatibility with CC2500 transceiver
		010	TX	Transmit mode
		011	FSTXON	Fast TX ready
		100	CALIBRATE	Frequency synthesizer calibration is running
		101	SETTLING	PLL is settling
		110	Not used (RXFIFO_OVERFLOW)	Not used, included for software compatibility with CC2500 transceiver
		111	TXFIFO_UNDERFLOW	TX FIFO has underflowed. Acknowledge with SFTX
3:0	FIFO_BYTES_AVAILABLE[3:0]	The number of free bytes in the TX FIFO. If FIFO_BYTES_AVAILABLE=15, it indicates that 15 or more bytes are available/free.		

Table 15: Status byte summary

Figure 7: Register access types

18 Microcontroller Interface and Pin Configuration

In a typical system, **CC2550** will interface to a microcontroller. This microcontroller must be able to:

- Program **CC2550** into different modes,
- Write buffered data
- Read back status information via the 4-wire SPI-bus configuration interface (SI, SO, SCLK and CSn).

18.1 Configuration Interface

The microcontroller uses four I/O pins for the SPI configuration interface (SI, SO, SCLK and

CSn). The SPI is described in Section 0 on page 12.

18.2 General Control and Status Pins

The **CC2550** has one dedicated configurable pin and one shared pin that can output internal status information useful for control software. These pins can be used to generate interrupts on the MCU. See Section 31 page 27 for more details of the signals that can be programmed. The dedicated pin is called GDO0. The shared pin is the SO pin in the SPI interface. The default setting for GDO1/SO is 3-state output. By selecting any other of the programming

options the GDO1/SO pin will become a generic pin. When CSn is low, the pin will always function as a normal SO pin.

In the synchronous and asynchronous serial modes, the GDO0 pin is used as a serial TX data input pin while in transmit mode.

The GDO0 pin can also be used for an on-chip analog temperature sensor. By measuring the voltage on the GDO0 pin with an external ADC, the temperature can be calculated.

Specifications for the temperature sensor are found in section 9 on page 7.

The temperature sensor output is usually only available when the frequency synthesizer is enabled (e.g. the MANCAL, FSTXON and TX states). It is necessary to write 0xBF to the PTEST register to use the analog temperature sensor in the IDLE state. Before leaving the IDLE state, the PTEST register should be restored to its default value (0x7F).

19 Data Rate Programming

The data rate used when transmitting is programmed by the MDMCFG3.DRATE_M and the MDMCFG4.DRATE_E configuration registers. The data rate is given by the formula below. As the formula shows, the programmed data rate depends on the crystal frequency.

$$R_{DATA} = \frac{(256 + DRATE_M) \cdot 2^{DRATE_E}}{2^{28}} \cdot f_{XOSC}$$

The following approach can be used to find suitable values for a given data rate:

$$DRATE_E = \left\lceil \log_2 \left(\frac{R_{DATA} \cdot 2^{20}}{f_{XOSC}} \right) \right\rceil$$

$$DRATE_M = \frac{R_{DATA} \cdot 2^{28}}{f_{XOSC} \cdot 2^{DRATE_E}} - 256$$

If DRATE_M is rounded to the nearest integer and becomes 256, increment DRATE_E and use DRATE_M=0.

20 Packet Handling Hardware Support

The **CC2550** has built-in hardware support for packet oriented radio protocols.

In transmit mode, the packet handler will add the following elements to the packet stored in the TX FIFO:

- A programmable number of preamble bytes.
- A two byte Synchronization Word. Can be duplicated to give a 4-byte sync word.
- Optionally whiten the data with a PN9 sequence.
- Optionally Interleave and Forward Error Code the data.
- Optionally compute and add a CRC checksum over the data field.

The recommended setting is 4-byte preamble and 2-byte sync word.

20.1 Data whitening

From a radio perspective, the ideal over the air data are random and DC free. This results in the smoothest power distribution over the occupied bandwidth. This also gives the

regulation loops in the receiver uniform operation conditions (no data dependencies).

Real world data often contain long sequences of zeros and ones. Performance can then be improved by whitening the data before transmitting, and de-whitening in the receiver. With **CC2550**, in combination with a **CC2500** at the receiver end, this can be done automatically by setting WHITE_DATA=1 in the PKTCTRL0 register. All data, except the preamble and the sync word, are then XOR-ed with a 9-bit pseudo-random (PN9) sequence before being transmitted. At the receiver end, the data are XOR-ed with the same pseudo-random sequence. This way, the whitening is reversed, and the original data appear in the receiver.

Setting PKTCTRL0.WHITE_DATA=1 is recommended for all uses, except when over-the-air compatibility with other systems is needed.

20.2 Packet format

The format of the data packet can be configured and consists of the following items:

- Preamble

- Synchronization word
- Length byte or constant programmable packet length
- Optional Address byte
- Payload
- Optional 2 byte CRC

The preamble pattern is an alternating sequence of ones and zeros (01010101...). The minimum length of the preamble is programmable. When enabling TX, the modulator will start transmitting the preamble. When the programmed number of preamble bytes has been transmitted, the modulator will send the sync word and then data from the TX FIFO if data is available. If the TX FIFO is empty, the modulator will continue to send preamble bytes until the first byte is written to the TX FIFO. The modulator will then send the sync word and then the data bytes.

The number of preamble bytes is programmed with the `MDMCFG1.NUM_PREAMBLE` value.

The synchronization word is a two-byte value set in the `SYNC1` and `SYNC0` registers. The sync word provides byte synchronization of the incoming packet. A one-byte synch word can be emulated by setting the `SYNC1` value to the preamble pattern. It is also possible to emulate a 32 bit sync word by using `MDMCFG2.SYNC_MODE=3` or `7`. The sync word will then be repeated twice.

CC2550 supports both constant packet length protocols and variable length protocols. The maximum packet length is 255 bytes. Constant packet length mode is selected by setting `PKTCTRL0.LENGTH_CONFIG=0`. The desired packet length is set by the `PKTLEN` register. The packet length is defined as the payload data, excluding the length byte and the optional automatic CRC.

Note that the minimum packet length supported (excluding the optional length byte and CRC) is one byte of payload data.

With `PKTCTRL0.LENGTH_CONFIG=2`, the packet length is set to infinite and transmission will continue until turned off manually. The infinite mode can be turned off while a packet is being transmitted. As described in the next section, this can be used to support packet formats with different length configuration than natively supported by **CC2550**.

20.2.1 Arbitrary length field configuration

By utilizing the infinite packet length option, arbitrary packet length is available. At the start of the packet, the infinite mode must be active. When less than 256 bytes remains of the packet, the MCU sets the `PKTLEN` register to `mod(length, 256)`, disables infinite packet length and activates fixed length packets. When the internal byte counter reaches the `PKTLEN` value, the packet transmission ends. Automatic CRC appending can be used (by setting `PKTCTRL0.CRC_EN` to 1).

When for example a 454-byte packet is to be transmitted, the MCU does the following:

- Set `PKTCTRL0.LENGTH_CONFIG=2` (10).
- Pre-program the `PKTLEN` register to `mod(454,256)=198`.
- Transmit at least 198 bytes, for example by filling the 64-byte TX FIFO four times (256 bytes transmitted).
- Set `PKTCTRL0.LENGTH_CONFIG=0` (00).
- The transmission ends when the packet counter reaches 198. A total of $256+198=454$ bytes are transmitted.

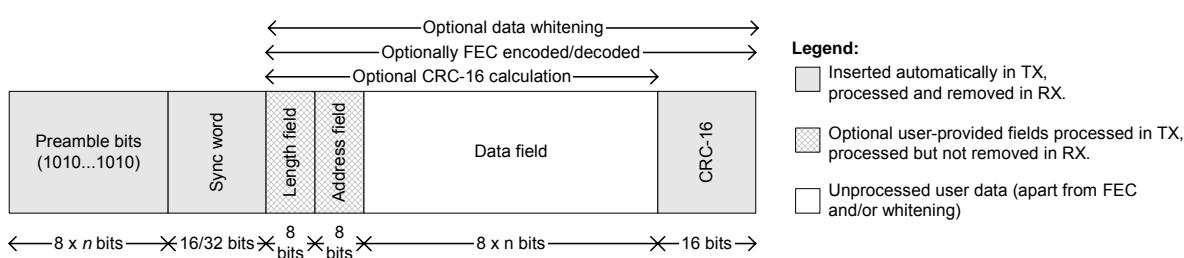

Figure 8: Packet Format

20.3 Packet Handling in Transmit Mode

The payload that is to be transmitted must be written into the TX FIFO. The first byte written must be the length byte when variable packet length is enabled. The length byte has a value equal to the payload of the packet (including the optional address byte). If fixed packet length is enabled, then the first byte written to the TX FIFO is interpreted as the destination address, if this feature is enabled in the device that receives the packet.

The modulator will first send the programmed number of preamble bytes. If data is available in the TX FIFO, the modulator will send the

two-byte (optionally 4-byte) sync word and then the payload in the TX FIFO. If CRC is enabled, the checksum is calculated over all the data pulled from the TX FIFO and the result is sent as two extra bytes at the end of the payload data.

If whitening is enabled, the length byte, payload data and the two CRC bytes will be whitened. This is done before the optional FEC/Interleaver stage. Whitening is enabled by setting `PKTCTRL0.WHITE_DATA=1`.

If FEC/Interleaving is enabled, the length byte, payload data and the two CRC bytes will be scrambled by the interleaver, and FEC encoded before being modulated.

21 Modulation Formats

CC2550 supports amplitude, frequency and phase shift modulation formats. The desired modulation format is set in the `MDMCFG2.MOD_FORMAT` register.

Optionally, the data stream can be Manchester coded by the modulator. This option is enabled by setting `MDMCFG2.MANCHESTER_EN=1`. Manchester encoding is not supported at the same time as using the FEC/Interleaver option. Manchester coding can be used with the 2-ary modulation formats (2-FSK, ASK/OOK and MSK).

21.1 Frequency Shift Keying

The frequency deviation is programmed with the `DEVIATION_M` and `DEVIATION_E` values in the `DEVIATN` register. The value has an exponent/mantissa form, and the resultant deviation is given by:

$$f_{dev} = \frac{f_{xosc}}{2^{17}} \cdot (8 + DEVIATION_M) \cdot 2^{DEVIATION_E}$$

The symbol encoding is shown in Table 16.

Format	Symbol	Coding
2FSK	'0'	- Deviation
	'1'	+ Deviation

Table 16: Symbol encoding for FSK modulation

21.2 Phase Shift Keying

When using MSK¹, the complete transmission (preamble, sync word and payload) will be MSK modulated.

Phase shifts are performed with a constant transition time. This means that the rate of change for the 180-degree transition is twice that of the 90-degree transition.

The fraction of a symbol period used to change the phase can be modified with the `DEVIATN.DEVIATION_M` setting. This is equivalent to changing the shaping of the symbol.

21.3 Amplitude Modulation

CC2550 supports two different forms of amplitude modulation: On-Off Keying (OOK) and Amplitude Shift Keying (ASK). OOK modulation simply turns on or off the PA to modulate 1 and 0 respectively. When using ASK the modulation depth (the difference between 1 and 0) can be programmed, and the power ramping will be shaped. This will produce a more bandwidth constrained output spectrum.

¹ Identical to offset QPSK with half-sine shaping (data coding may differ)

22 Forward Error Correction with Interleaving

22.1 Forward Error Correction (FEC)

CC2550 has built in support for Forward Error Correction (FEC) that can be used with **CC2500** at the receiver end. To enable this option, set MDMCFG1.FEC_EN to 1. FEC is employed on the data field and CRC word in order to reduce the gross bit error rate when operating near the sensitivity limit. Redundancy is added to the transmitted data in such a way that the receiver can restore the original data in the presence of some bit errors.

The use of FEC allows correct reception at a lower SNR, thus extending communication range. Alternatively, for a given SNR, using FEC decreases the bit error rate (BER). As the packet error rate (PER) is related to BER by:

$$PER = 1 - (1 - BER)^{\text{packet_length}},$$

a lower BER can be used to allow significantly longer packets, or a higher percentage of packets of a given length, to be transmitted successfully. Finally, in realistic ISM radio environments, transient and time-varying phenomena will produce occasional errors even in otherwise good reception conditions. FEC will mask such errors and, combined with interleaving of the coded data, even correct relatively long periods of faulty reception (burst errors).

The FEC scheme adopted for **CC2550** is convolutional coding, in which n bits are generated based on k input bits and the m most recent input bits, forming a code stream able to withstand a certain number of bit errors between each coding state (the m -bit window).

The convolutional coder is a rate 1/2 code with a constraint length of $m=4$. The coder codes one input bit and produces two output bits; hence, the effective data rate is halved.

22.2 Interleaving

Data received through real radio channels will often experience burst errors due to interference and time-varying signal strengths. In order to increase the robustness to errors spanning multiple bits, interleaving is used when FEC is enabled. After de-interleaving, a continuous span of errors in the received stream will become single errors spread apart.

CC2550 employs matrix interleaving, which is illustrated in Figure 9. The on-chip interleaving and de-interleaving buffers are 4×4 matrices. In the transmitter, the data bits are written into the rows of the matrix, whereas the bit sequence to be transmitted is read from the columns of the matrix and fed to the rate $1/2$ convolutional coder. Conversely, in a **CC2500** receiver, the received symbols are written into the columns of the matrix, whereas the data passed onto the convolutional decoder is read from the rows of the matrix.

When FEC and interleaving is used, the amount of data transmitted over the air must be a multiple of the size of the interleaver buffer (two bytes). In addition, at least one extra byte is required for trellis termination. The packet control hardware therefore automatically inserts one or two extra bytes at the end of the packet, so that the total length of the data to be interleaved is an even number. Note that these extra bytes are invisible to the user, as they are removed before the received packet enters the RX FIFO in a **CC2500**.

Due to the implementation of the FEC and interleaver, the data to be interleaved must be at least two bytes. One byte long fixed length packets without CRC is therefore not supported when FEC/interleaving is enabled.

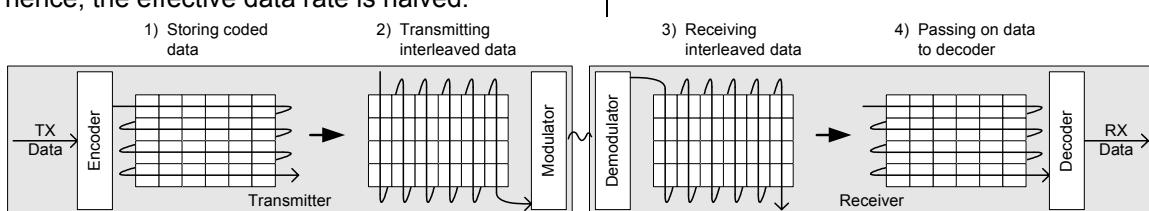

Figure 9: General principle of matrix interleaving

23 Radio Control

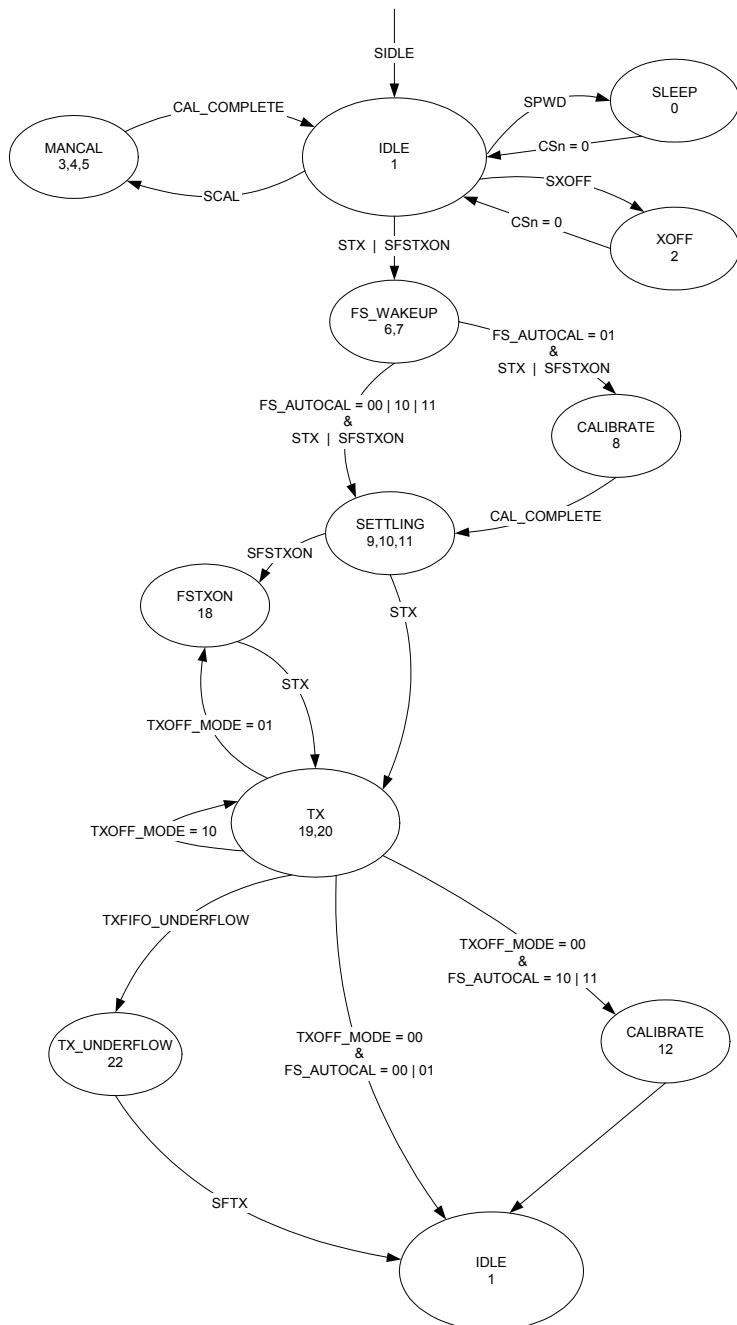

Figure 10: Radio Control State Diagram

CC2550 has a built-in state machine that is used to switch between different operation states (modes). The change of state is done either by using command strobes or by internal events such as TX FIFO underflow.

A simplified state diagram, together with typical usage and current consumption, is shown in Figure 4 on page 12. The complete

radio control state diagram is shown in Figure 10. The numbers refer to the state number readable in the MARCSTATE status register. This functionality is primarily for test purposes.

23.1 Power on start-up sequence

When the power supply is turned on, the system must be reset. One of the following two sequences must be followed: Automatic power-on reset or manual reset.

A power-on reset circuit is included in the **CC2550**. The minimum requirements stated in Section 11 must be followed for the power-on reset to function properly. The internal power-up sequence is completed when `CHIP_RDYn` goes low. `CHIP_RDYn` is observed on the `SO` pin after `CSn` is pulled low. See Section 17.1 for more details on `CHIP_RDYn`.

The other global reset possibility on **CC2550** is the `SRES` command strobe. By issuing this strobe, all internal registers and states are set to the default, idle state. The power-up sequence is as follows (see Figure 11):

- Set `SCLK=1` and `SI=0`.
- Strobe `CSn` low / high.
- Hold `CSn` high for at least 40µs.
- Pull `CSn` low and wait for `SO` to go low (`CHIP_RDYn`).
- Issue the `SRES` strobe.
- When `SO` goes low again, reset is complete and the chip is in the IDLE state.

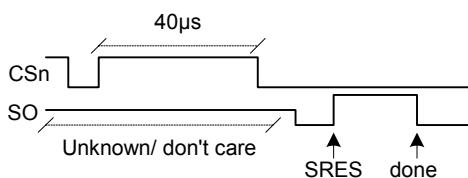

Figure 11: Power-up with SRES

It is recommended to always send a `SRES` command strobe on the SPI interface after power-on even though power-on reset is used.

23.2 Crystal Control

The crystal oscillator is automatically turned on when `CSn` goes low. It will be turned off if the `SXOFF` or `SPWD` command strobes are issued; the state machine then goes to `XOFF` or `SLEEP` respectively. This can be done from any state. The `XOSC` will be turned off when `CSn` is released (goes high). The `XOSC` will be automatically turned on again when `CSn` goes low. The state machine will then go to the

IDLE state. The `SO` pin on the SPI interface must be zero before the SPI interface is ready to be used; as described in Section 0 on page 13.

Crystal oscillator start-up time depends on crystal ESR and load capacitances. The electrical specification for the crystal oscillator can be found in section 7 on page 6.

23.3 Voltage Regulator Control

The voltage regulator to the digital core is controlled by the radio controller. When the chip enters the `SLEEP` state, which is the state with the lowest current consumption, this regulator is disabled. This occurs after `CSn` is released when a `SPWD` command strobe has been sent on the SPI interface. The chip is now in the `SLEEP` state. Setting `CSn` low again will turn on the regulator and crystal oscillator and make the chip enter the IDLE state.

On the **CC2550**, all register values (with the exception of the `MCSM0.PO_TIMEOUT` field) are lost in the `SLEEP` state. After the chip gets back to the IDLE state, the registers will have default (reset) contents and must be reprogrammed over the SPI interface.

23.4 Active Mode

The active transmit mode is activated by the MCU by using the `STX` command strobe.

The frequency synthesizer must be calibrated regularly. **CC2550** has one manual calibration option (using the `SCAL` strobe), and three automatic calibration options, controlled by the `MCSM0.FS_AUTOCAL` setting:

- Calibrate when going from IDLE to TX (or `FSTXON`)
- Calibrate when going from TX to IDLE
- Calibrate every fourth time when going from TX to IDLE

The calibration takes a constant number of `XOSC` cycles (see Table 17 for timing details).

When TX is active, the chip will remain in the TX state until the current packet has been successfully transmitted. Then the state will change as indicated by the `MCSM1.TXOFF_MODE` setting. The possible destinations are:

- IDLE

- FSTXON: Frequency synthesizer on and ready at the TX frequency. Activate TX with STX.
- TX: Start sending preambles

The SIDLE command strobe can always be used to force the radio controller to go to the IDLE state.

23.5 Timing

The radio controller controls most timing in **CC2550**, such as synthesizer calibration and PLL lock. Timing from IDLE to TX is constant, dependent on the auto calibration setting. The calibration time is constant 18739 clock periods. Table 17 shows timing in crystal clock cycles for key state transitions.

24 Data FIFO

The **CC2550** contains a 64 byte FIFO for data to be transmitted. The SPI interface is used for writing to the TX FIFO. Section 17.4 contains details on the SPI FIFO access. The FIFO controller will detect underflow in the TX FIFO.

When writing to the TX FIFO it is the responsibility of the MCU to avoid TX FIFO overflow. This will not be detected by the **CC2550**.

The chip status byte that is available on the SO pin while transferring the SPI address contains the fill grade of the TX FIFO. Section 17.1 on page 13 contains more details on this.

The number of bytes in the TX FIFO can also be read from the TXBYTES.NUM_TXBYTES status register.

The 4-bit FIFOTHR.FIFO_THR setting is used to program the FIFO threshold point. Table 18 lists the 16 FIFO_THR settings and the corresponding thresholds for the TX FIFO.

A flag will assert when the number of bytes in the FIFO is equal to or higher than the programmed threshold. The flag is used to generate the FIFO status signals that can be viewed on the GDO pins (see Section 31 on page 27).

Figure 13 shows the number of bytes in the TX FIFO when the threshold flag toggles, in the case of FIFO_THR=13. Figure 12 shows the flag as the FIFO is filled above the threshold, and then drained below.

Power on time and XOSC start-up times are variable, but within the limits stated in Table 6.

Description	XOSC periods	26MHz crystal
Idle to TX/FSTXON, no calibration	2298	88.4µs
Idle to TX/FSTXON, with calibration	~21037	809µs
TX to IDLE, no calibration	2	0.1µs
TX to IDLE, including calibration	~18739	721µs
Manual calibration	~18739	721µs

Table 17: State transition timing

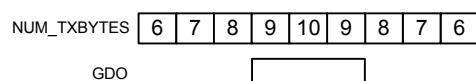

Figure 12: FIFO_THR=13 vs. number of bytes in FIFO

FIFO_THR	Bytes in TX FIFO
0 (0000)	61
1 (0001)	57
2 (0010)	53
3 (0011)	49
4 (0100)	45
5 (0101)	41

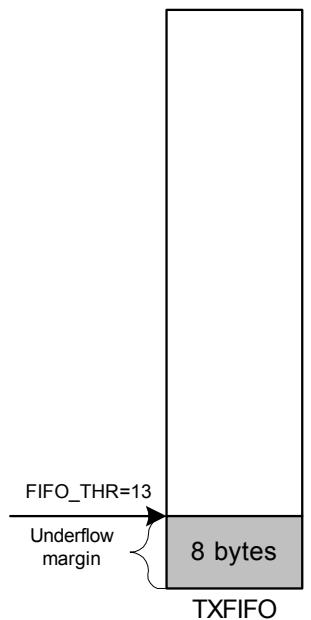

Figure 13: Example of FIFO at threshold

25 Frequency Programming

The frequency programming in **CC2550** is designed to minimize the programming needed in a channel-oriented system.

To set up a system with channel numbers, the desired channel spacing is programmed with the `MDMCFG0.CHANSPC_M` and `MDMCFG1.CHANSPC_E` registers. The channel spacing registers are mantissa and exponent respectively.

The base or start frequency is set by the 24 bit frequency word located in the `FREQ2`, `FREQ1` and `FREQ0` registers. This word will typically be set to the centre of the lowest channel frequency that is to be used.

The desired channel number is programmed with the 8-bit channel number register, `CHANNR.CHAN`, which is multiplied by the channel offset. The resultant carrier frequency is given by:

$$f_{carrier} = \frac{f_{XOSC}}{2^{16}} \cdot (FREQ + CHAN \cdot (256 + CHANSPC_M \cdot 2^{CHANSPC_E-2}))$$

If any frequency programming register is altered when the frequency synthesizer is running, the synthesizer may give an

undesired response. Hence, the frequency programming should only be updated when the radio is in the IDLE state.

26 VCO

The VCO is completely integrated on-chip.

26.1 VCO and PLL Self-Calibration

The VCO characteristics will vary with temperature and supply voltage changes, as well as the desired operating frequency. In order to ensure reliable operation, **CC2550** includes frequency synthesizer self-calibration circuitry. This calibration should be done regularly, and must be performed after turning on power and before using a new frequency (or channel). The number of XOSC cycles for completing the PLL calibration is given in Table 17 on page 23.

The calibration can be initiated automatically or manually. The synthesizer can be automatically calibrated each time the synthesizer is turned on, or each time the synthesizer is turned off. This is configured with the `MCSM0.FS_AUTOCAL` register setting. In manual mode, the calibration is initiated when the `SCAL` command strobe is activated in the `IDLE` mode. The default setting is to calibrate each time the frequency synthesizer is turned on.

The calibration values are not maintained in sleep mode. Therefore, the **CC2550** must be recalibrated after reprogramming the configuration registers when the chip has been in the `SLEEP` state.

27 Voltage Regulators

CC2550 contains several on-chip linear voltage regulators, which generate the supply voltage needed by low-voltage modules. These voltage regulators are invisible to the user, and can be viewed as integral parts of the various modules. The user must however make sure that the absolute maximum ratings and required pin voltages in Table 1 and Table 11 are not exceeded. The voltage regulator for the digital core requires one external decoupling capacitor.

Setting the `CSn` pin low turns on the voltage regulator to the digital core and starts the

crystal oscillator. The `SO` pin on the SPI interface must go low before using the serial interface (setup time is TBD).

On initial power up, the MCU must set `CSn` low and issue the reset command strobe `SRES`.

If the chip is programmed to enter power-down mode, (`SPWD` strobe issued), the power will be turned off after `CSn` goes high. The power and crystal oscillator will be turned on again when `CSn` goes low.

The voltage regulator output should only be used for driving the **CC2550**.

28 Output Power Programming

The RF output power level from the device has two levels of programmability, as illustrated in Figure 14. Firstly, the special `PATABLE` register can hold up to eight user selected output power settings. Secondly, the 3-bit `FRENDO.PA_POWER` value selects the `PATABLE` entry to use. This two-level functionality provides flexible PA power ramp up and ramp down at the start and end of transmission, as well as ASK modulation shaping. In each case, all the PA power settings in the `PATABLE` from index 0 up to the `FRENDO.PA_POWER` value are used.

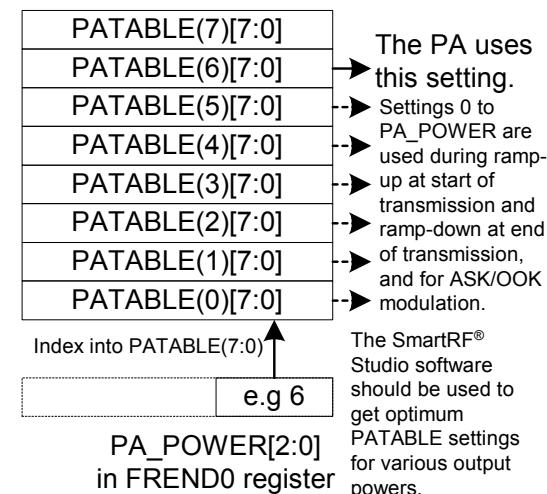

Figure 14: PA_POWER and PATABLE

The power ramping at the start and at the end of a packet can be turned off by setting FREND0.PA_POWER to zero and then programming the desired output power to index zero in the PATABLE.

Table 19 contains recommended PATABLE settings for various output levels and frequency bands. See section 17.5 on page 14 for PATABLE programming details.

With ASK modulation, the eight power settings are used for shaping. The modulator contains a counter that counts up when transmitting a

one and down when transmitting a zero. The counter counts at a rate equal to 8 times the symbol rate. The counter saturates at FREND0.PA_POWER and 0 respectively. This counter value is used as an index for a lookup in the power table. Thus, in order to utilize the whole table, FREND0.PA_POWER should be 7 when ASK is active. The shaping of the ASK signal is dependent on the configuration of the PATABLE.

Output power [dBm]	Setting	Current consumption, typ. [mA]
(-55 or less)	0x00	10.1
-30	0x44	11.2
-28	0x43	11.6
-26	0x52	11.9
-24	0x82	11.8
-22	0x45	11.6
-20	0xC1	12.2
-18	0xC8	13.6
-16	0x85	12.1
-14	0x67	14.3
-12	0xC6	12.8
-10	0x97	13.9
-8	0xD5	14.9
-6	0x7F	16.4
-4	0xAA	18.1
-2	0xBF	19.8
0	0xFB	22.8
1	0xFF	23.1

Table 19: Optimum PATABLE settings for various output power levels (subject to changes)

29 Crystal Oscillator

A crystal in the frequency range 26MHz-28MHz must be connected between the XOSC_Q1 and XOSC_Q2 pins. The oscillator is designed for parallel mode operation of the crystal. In addition, loading capacitors (C51 and C71) for the crystal are required. The loading capacitor values depend on the total load capacitance, C_L , specified for the crystal. The total load capacitance seen between the crystal terminals should equal C_L for the crystal to oscillate at the specified frequency.

$$C_L = \frac{1}{\frac{1}{C_{51}} + \frac{1}{C_{71}}} + C_{parasitic}$$

The parasitic capacitance is constituted by pin input capacitance and PCB stray capacitance. Total parasitic capacitance is typically 2.5pF.

The crystal oscillator circuit is shown in Figure 15. Typical component values for different values of C_L are given in Table 20.

The crystal oscillator is amplitude regulated. This means that a high current is used to start up the oscillations. When the amplitude builds up, the current is reduced to what is necessary to maintain approximately 0.4Vpp signal swing. This ensures a fast start-up, and keeps the drive level to a minimum. The ESR of the crystal should be within the specification in order to ensure a reliable start-up (see section 7 on page 6).

The initial tolerance, temperature drift, aging and load pulling should be carefully specified

in order to meet the required frequency accuracy in a certain application. By specifying the *total* expected frequency accuracy in SmartRF® Studio together with data rate and frequency deviation, the software calculates the total bandwidth and compares this to the chosen receiver channel filter bandwidth. The software reports any contradictions, and a more accurate crystal is recommended if required.

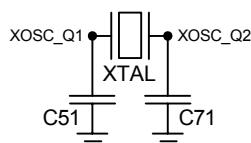

Figure 15: Crystal oscillator circuit

C101	15pF	22pF	27pF

Table 20: Crystal oscillator component values

30 Antenna Interface

The balanced RF output of **CC2550** is designed for a simple, low-cost matching and balun network on the printed circuit board. A few passive external components ensure proper matching.

Although **CC2550** has a balanced RF output, the chip can be connected to a single-ended antenna with few external low cost capacitors and inductors.

31 General Purpose / Test Output Control Pins

The two digital output pins GDO0 and GDO1 are general control pins. Their functions are programmed by `IOCFG0.GDO0_CFG` and `IOCFG1.GDO1_CFG` respectively. Table 21 shows the different signals that can be monitored on the GDO pins. These signals can be used as an interrupt to the MCU. GDO1 is the same pin as the SO pin on the SPI interface, thus the output programmed on this pin will only be valid when CSn is high. The default value for GDO1 is 3-stated, which is useful when the SPI interface is shared with other devices.

The default value for GDO0 is a 125kHz-146kHz clock output (XOSC frequency divided by 192). Since the XOSC is turned on at

power-on-reset, this can be used to clock the MCU in systems with only one crystal. When the MCU is up and running, it can change the clock frequency by writing to `IOCFG0.GDO0_CFG`. This will not produce any clock glitches.

An on-chip analog temperature sensor is enabled by writing the value 128 (0x80h) to the `IOCFG0.GDO0_CFG` register. The voltage on the GDO0 pin is then proportional to temperature. See section 9 on page 7 for temperature sensor specifications.

GDO0_CFG[5:0] GDO1_CFG[5:0]	Description
0 (0x00)	Reserved – defined on the transceiver version.
1 (0x01)	Reserved – defined on the transceiver version.
2 (0x02)	Associated to the TX FIFO: Asserts when the TX FIFO is filled above TXFIFO_THR. De-asserts when the TX FIFO is below TXFIFO_THR.
3 (0x03)	Associated to the TX FIFO: Asserts when TX FIFO is full. De-asserts when the TX FIFO is drained below TXFIFO_THR.
4 (0x04)	Reserved – defined on the transceiver version.
5 (0x05)	Asserts when the TX FIFO has underflowed. De-asserts when the FIFO is flushed.
6 (0x06)	Asserts when sync word has been sent, and de-asserts at the end of the packet. The pin will also de-assert if the TX FIFO underflows.
7 (0x07)	Reserved – defined on the transceiver version.
8 (0x08)	Reserved – defined on the transceiver version.
9 (0x09)	Reserved – defined on the transceiver version.
10 (0x0A)	Lock detector output
11 (0x0B)	Serial Clock. Synchronous to the data in synchronous serial mode. Data is set up on the falling edge and is read on the rising edge of SERIAL_CLK.
12 (0x0C)	Reserved – defined on the transceiver version.
13 (0x0D)	Reserved – defined on the transceiver version.
14 (0x0E)	Reserved – defined on the transceiver version.
15 (0x0F)	Reserved – defined on the transceiver version.
16 (0x10)	Reserved – used for test.
17 (0x11)	Reserved – used for test.
18 (0x12)	Reserved – used for test.
19 (0x13)	Reserved – used for test.
20 (0x14)	Reserved – used for test.
21 (0x15)	Reserved – used for test.
22 (0x16)	Reserved – defined on the transceiver version.
23 (0x17)	Reserved – defined on the transceiver version.
24 (0x18)	Reserved – used for test.
25 (0x19)	Reserved – used for test.
26 (0x1A)	Reserved – used for test.
27 (0x1B)	PA_PD. PA is enabled when 1, in power-down when 0. Can be used to control external PA or RX/TX switch.
28 (0x1C)	Reserved – defined on the transceiver version.
29 (0x1D)	Reserved – defined on the transceiver version.
30 (0x1E)	Reserved – used for test.
31 (0x1F)	Reserved – used for test.
32 (0x20)	Reserved – used for test.
33 (0x21)	Reserved – used for test.
34 (0x22)	Reserved – used for test.
35 (0x23)	Reserved – used for test.
36 (0x24)	Reserved – used for test.
37 (0x25)	Reserved – used for test.
38 (0x26)	Reserved – used for test.
39 (0x27)	Reserved – used for test.
40 (0x28)	Reserved – used for test.
41 (0x29)	CHIP_RDY
42 (0x2A)	Reserved – used for test.
43 (0x2B)	XOSC_STABLE
44 (0x2C)	Reserved – used for test.
45 (0x2D)	GDO0_Z_EN_N. When this output is 0, GDO0 is configured as input (for serial TX data).
46 (0x2E)	High impedance (3-state)
47 (0x2F)	HW to 0 (HW1 achieved with _INV signal)
48 (0x30)	CLK_XOSC/1
49 (0x31)	CLK_XOSC/1.5
50 (0x32)	CLK_XOSC/2
51 (0x33)	CLK_XOSC/3
52 (0x34)	CLK_XOSC/4
53 (0x35)	CLK_XOSC/6
54 (0x36)	CLK_XOSC/8
55 (0x37)	CLK_XOSC/12
56 (0x38)	CLK_XOSC/16
57 (0x39)	CLK_XOSC/24
58 (0x3A)	CLK_XOSC/32
59 (0x3B)	CLK_XOSC/48
60 (0x3C)	CLK_XOSC/64
61 (0x3D)	CLK_XOSC/96
62 (0x3E)	CLK_XOSC/128
63 (0x3F)	CLK_XOSC/192

Table 21: GDO signal selection

32 Asynchronous and Synchronous Serial Operation

Several features and modes of operation have been included in the **CC2550** to provide backward compatibility with previous Chipcon products and other existing RF communication systems. For new systems, it is recommended to use the built-in packet handling features, as they can give more robust communication, significantly offload the microcontroller and simplify software development.

32.1 Asynchronous operation

For backward compatibility with systems already using the asynchronous data transfer from other Chipcon products, asynchronous transfer is also included in **CC2550**. When asynchronous transfer is enabled, several of the support mechanisms for the MCU that are included in **CC2550** will be disabled, such as packet handling hardware, buffering in the FIFO and so on. The asynchronous transfer mode does not allow the use of the data whitener, interleaver and FEC.

Only 2-FSK and ASK/OOK are supported for asynchronous transfer.

Setting `PKTCTRL0.PKT_FORMAT` to 3 enables asynchronous transparent (serial) mode.

In TX, the `GDO0` pin is used for data input (TX data).

The MCU must control start and stop of transmit with the `STX` and `SIDLE` strobes.

The **CC2550** modulator samples the level of the asynchronous input 8 times faster than the programmed data rate. The timing requirement for the asynchronous stream is that the error in the bit period must be less than one eighth of the programmed data rate.

32.2 Synchronous serial operation

In the Synchronous serial operation mode, data is transferred on a two wire serial interface. The **CC2550** provides a clock that is used to set up new data on the data input line. Data input (TX data) is the `GDO0` pin. This pin will automatically be configured as an input when TX is active.

Preamble and sync word insertion may or may not be active, dependent on the sync mode set by the `MDMCFG3.SYNC_MODE`. If preamble and sync word is disabled, all other packet handler features and FEC should also be disabled. The MCU must then handle preamble and sync word insertion in software. If preamble and sync word insertion is left on, all packet handling features and FEC can be used. The **CC2550** will insert the preamble and sync word and the MCU will only provide the data payload. This is equivalent to the recommended FIFO operation mode.

33 Configuration Registers

The configuration of **CC2550** is done by programming 8-bit registers. The configuration data based on selected system parameters are most easily found by using the SmartRF® Studio software. Complete descriptions of the registers are given in the following tables. After chip reset, all the registers have default values as shown in the tables.

There are nine Command Strobe Registers, listed in Table 22. Accessing these registers will initiate the change of an internal state or mode. There are 30 normal 8-bit Configuration Registers, listed in Table 23. Many of these registers are for test purposes only, and need not be written for normal operation of **CC2550**.

There are also six Status registers, which are listed in Table 24. These registers, which are

read-only, contain information about the status of **CC2550**.

The TX FIFO is accessed through one 8-bit register. Only write operations are allowed to the TX FIFO.

During the address transfer and while writing to a register or the TX FIFO, a status byte is returned. This status byte is described in Table 15 on page 16.

Table 25 summarizes the SPI address space. Registers that are only defined on the **CC2500** transceiver are also listed. **CC2500** and **CC2550** are register compatible, but registers and fields only implemented in the transceiver always contain zero on **CC2550**.

The address to use is given by adding the base address to the left and the burst and read/write bits on the top. Note that the burst

bit has different meaning for base addresses above and below 0x2F.

Address	Strobe Name	Description
0x30	SRES	Reset chip.
0x31	SFSTXON	Enable and calibrate frequency synthesizer (if MCSM0 . FS_AUTOCAL=1).
0x32	SXOFF	Turn off crystal oscillator.
0x33	SCAL	Calibrate frequency synthesizer and turn it off (enables quick start).
0x35	STX	Enable TX. Perform calibration first if MCSM0 . FS_AUTOCAL=1.
0x36	SIDLE	Exit TX and turn off frequency synthesizer.
0x39	SPWD	Enter power down mode when CSn goes high.
0x3B	SFTX	Flush the TX FIFO buffer.
0x3D	SNOP	No operation. May be used to pad strobe commands to two bytes for simpler software.

Table 22: Command Strobes

Address	Register	Description	Details on page number
0x01	IOCFG1	GDO1 output pin configuration	33
0x02	IOCFG0	GDO0 output pin configuration	33
0x03	FIFOTHRESHOLD	FIFO threshold	33
0x04	SYNC1	Sync word, high byte	34
0x05	SYNC0	Sync word, low byte	34

Table 25: SPI Address Space (greyed text: for reference only; not implemented on CC2550)

33.1 Configuration Register Details

0x01: IOCFG1 – GDO1 output pin configuration

Bit	Field Name	Reset	R/W	Description
7	GDO_DS	0	R/W	Set high (1) or low (0) output drive strength on the GDO pins.
6	GDO1_INV	0	R/W	Invert output, i.e. select active low / high
5:0	GDO1_CFG[5:0]	46 (0x2E)	R/W	Default is 3-state (see Table 21 on page 28)

0x02: IOCFG0 – GDO0 output pin configuration

Bit	Field Name	Reset	R/W	Description
7	TEMP_SENSOR_ENABLE	0	R/W	Enable analog temperature sensor. Write 0 in all other register bits when using temperature sensor.
6	GDO0_INV	0	R/W	Invert output, i.e. select active low / high
5:0	GDO0_CFG[5:0]	63 (0x3F)	R/W	Default is CLK_XOSC/192 (see Table 21 on page 28)

0x03: FIFOTHR – FIFO threshold

Bit	Field Name	Reset	R/W	Description																																		
7:4	Reserved	0 (0000)	R/W	Write 0 (0000) for compatibility with possible future extensions.																																		
3:0	FIFO_THR[3:0]	7 (0111)	R/W	<p>Set the threshold for the TX FIFO. The threshold is exceeded when the number of bytes in the FIFO is equal to or higher than the threshold value.</p> <table border="1"> <thead> <tr> <th>Setting</th> <th>Bytes in TX FIFO</th> </tr> </thead> <tbody> <tr> <td>0 (0000)</td> <td>61</td> </tr> <tr> <td>1 (0001)</td> <td>57</td> </tr> <tr> <td>2 (0010)</td> <td>53</td> </tr> <tr> <td>3 (0011)</td> <td>49</td> </tr> <tr> <td>4 (0100)</td> <td>45</td> </tr> <tr> <td>5 (0101)</td> <td>41</td> </tr> <tr> <td>6 (0110)</td> <td>37</td> </tr> <tr> <td>7 (0111)</td> <td>33</td> </tr> <tr> <td>8 (1000)</td> <td>29</td> </tr> <tr> <td>9 (1001)</td> <td>25</td> </tr> <tr> <td>10 (1010)</td> <td>21</td> </tr> <tr> <td>11 (1011)</td> <td>17</td> </tr> <tr> <td>12 (1100)</td> <td>13</td> </tr> <tr> <td>13 (1101)</td> <td>9</td> </tr> <tr> <td>14 (1110)</td> <td>5</td> </tr> <tr> <td>15 (1111)</td> <td>1</td> </tr> </tbody> </table>	Setting	Bytes in TX FIFO	0 (0000)	61	1 (0001)	57	2 (0010)	53	3 (0011)	49	4 (0100)	45	5 (0101)	41	6 (0110)	37	7 (0111)	33	8 (1000)	29	9 (1001)	25	10 (1010)	21	11 (1011)	17	12 (1100)	13	13 (1101)	9	14 (1110)	5	15 (1111)	1

3 (11)	Asynchronous transparent mode. Data in on GDO0 and Data out on either of the GDO pins													
3	CC2400_EN	0	R/W	Enable CC2400 support. Use same CRC implementation as CC2400.										
2	CRC_EN	1	R/W	1: CRC calculation enabled 0: CRC disabled										
1:0	LENGTH_CONFIG[1:0]	1 (01)	R/W	Configure the packet length <table border="1" data-bbox="730 1662 1341 1909"> <tr> <th>Setting</th> <th>Packet length configuration</th> </tr> <tr> <td>0 (00)</td> <td>Fixed length packets, length configured in PKTLEN register</td> </tr> <tr> <td>1 (01)</td> <td>Variable length packets, packet length configured by the first byte after sync word</td> </tr> <tr> <td>2 (10)</td> <td>Enable infinite length packets</td> </tr> <tr> <td>3 (11)</td> <td>Reserved</td> </tr> </table>	Setting	Packet length configuration	0 (00)	Fixed length packets, length configured in PKTLEN register	1 (01)	Variable length packets, packet length configured by the first byte after sync word	2 (10)	Enable infinite length packets	3 (11)	Reserved
Setting	Packet length configuration													
0 (00)	Fixed length packets, length configured in PKTLEN register													
1 (01)	Variable length packets, packet length configured by the first byte after sync word													
2 (10)	Enable infinite length packets													
3 (11)	Reserved													

0x09: ADDR – Device address

Bit	Field Name	Reset	R/W	Description
7:0	DEVICE_ADDR[7:0]	0 (0x00)	R/W	Address used for packet filtration. Optional broadcast addresses are 0 (0x00) and 255 (0xFF).

0x0A: CHANR – Channel number

Bit	Field Name	Reset	R/W	Description
7:0	CHAN[7:0]	0 (0x00)	R/W	The 8-bit unsigned channel number, which is multiplied by the channel spacing setting and added to the base frequency.

0x0D: FREQ2 – Frequency control word, high byte

Bit	Field Name	Reset	R/W	Description															
7:6	FREQ[23:22]	1 (01)	R	FREQ[23:22] is always binary 01 (the FREQ2 register is in the range 85 to 95 with 26MHz-28MHz crystal)															
5:0	FREQ[21:16]	30 (0x1E)	R/W	<p>FREQ[23:0] is the base frequency for the frequency synthesiser in increments of $F_{XOSC}/2^{16}$.</p> $f_{carrier} = \frac{f_{XOSC}}{2^{16}} \cdot FREQ[23:0]$ <p>The default frequency word gives a base frequency of 2464MHz, assuming a 26.0MHz crystal. With the default channel spacing settings, the following FREQ2 values and channel numbers can be used:</p> <table border="1"> <thead> <tr> <th>FREQ2</th> <th>Base frequency</th> <th>Frequency range (CHAN numbers)</th> </tr> </thead> <tbody> <tr> <td>91 (0x5B)</td> <td>2386MHz</td> <td>2400.2MHz-2437MHz (71-255)</td> </tr> <tr> <td>92 (0x5C)</td> <td>2412MHz</td> <td>2412MHz-2463MHz (0-255)</td> </tr> <tr> <td>93 (0x5D)</td> <td>2438MHz</td> <td>2431MHz-2483.4MHz (0-227)</td> </tr> <tr> <td>94 (0x5E)</td> <td>2464MHz</td> <td>2464MHz-2483.4MHz (0-97)</td> </tr> </tbody> </table>	FREQ2	Base frequency	Frequency range (CHAN numbers)	91 (0x5B)	2386MHz	2400.2MHz-2437MHz (71-255)	92 (0x5C)	2412MHz	2412MHz-2463MHz (0-255)	93 (0x5D)	2438MHz	2431MHz-2483.4MHz (0-227)	94 (0x5E)	2464MHz	2464MHz-2483.4MHz (0-97)
FREQ2	Base frequency	Frequency range (CHAN numbers)																	
91 (0x5B)	2386MHz	2400.2MHz-2437MHz (71-255)																	
92 (0x5C)	2412MHz	2412MHz-2463MHz (0-255)																	
93 (0x5D)	2438MHz	2431MHz-2483.4MHz (0-227)																	
94 (0x5E)	2464MHz	2464MHz-2483.4MHz (0-97)																	

0x0E: FREQ1 – Frequency control word, middle byte

Bit	Field Name	Reset	R/W	Description
7:0	FREQ[15:8]	196 (0xC4)	R/W	Ref. FREQ2 register

0x0F: FREQ0 – Frequency control word, low byte

Bit	Field Name	Reset	R/W	Description
7:0	FREQ[7:0]	236 (0xEC)	R/W	Ref. FREQ2 register

0x10: MDMCFG4 – Modulator configuration

Bit	Field Name	Reset	R/W	Description
7:4	Reserved		R0	Defined on the transceiver version
3:0	DRATE_E[3:0]	12 (1100)	R/W	The exponent of the user specified symbol rate

0x11: MDMCFG3 – Modulator configuration

Bit	Field Name	Reset	R/W	Description
7:0	DRATE_M[7:0]	34 (0x22)	R/W	<p>The mantissa of the user specified symbol rate. The symbol rate is configured using an unsigned, floating-point number with 9-bit mantissa and 4-bit exponent. The 9th bit is a hidden '1'. The resulting data rate is:</p> $R_{DATA} = \frac{(256 + DRATE_M) \cdot 2^{DRATE_E}}{2^{28}} \cdot f_{XOSC}$ <p>The default values give a data rate of 115.051kbps (closest setting to 115.2kbps), assuming a 26.0MHz crystal.</p>

0x12: MDMCFG2 – Modulator configuration

1:0	Reserved		R0	Defined on the transceiver version															

0x22: FREND0 – Front end TX configuration

Bit	Field Name	Reset	R/W	Description
7:6	Reserved		R0	
5:4	LODIV_BUF_CURRENT_TX[1:0]	1 (01)	R/W	Adjusts current TX LO buffer (input to PA). The value to use in this field is given by the SmartRF® Studio software.
3	Reserved		R0	
2:0	PA_POWER[2:0]	0 (000)	R/W	Selects PA power setting. This value is an index to the PATABLE, which can be programmed with up to 8 different PA settings. In ASK mode, this selects the PATABLE index to use when transmitting a '1'. PATABLE index zero is used in ASK when transmitting a '0'. The PATABLE settings from index '0' to the PA_POWER value are used for ASK TX shaping, and for power ramp-up/ramp-down at the start/end of transmission in all TX modulation formats.

0x23: FSCAL3 – Frequency synthesizer calibration

Bit	Field Name	Reset	R/W	Description
7:0	FSCAL3[7:0]	169 (0xA9)	R/W	Frequency synthesizer calibration configuration and result register. The value to write in this register before calibration is given by the SmartRF® Studio software. Fast frequency hopping without calibration for each hop can be done by calibrating upfront for each frequency and saving the resulting FSCAL3, FSCAL2 and FSCAL1 register values. Between each frequency hop, calibration can be replaced by writing the FSCAL3, FSCAL2 and FSCAL1 register values corresponding to the next RF frequency.

0x24: FSCAL2 – Frequency synthesizer calibration

Bit	Field Name	Reset	R/W	Description
7:6	Reserved		R0	
5:0	FSCAL2[5:0]	10 (0x0A)	R/W	Frequency synthesizer calibration result register. Fast frequency hopping without calibration for each hop can be done by calibrating upfront for each frequency and saving the resulting FSCAL3, FSCAL2 and FSCAL1 register values. Between each frequency hop, calibration can be replaced by writing the FSCAL3, FSCAL2 and FSCAL1 register values corresponding to the next RF frequency.

0x25: FSCAL1 – Frequency synthesizer calibration

Bit	Field Name	Reset	R/W	Description
7:6	Reserved		R0	
5:0	FSCAL1[5:0]	32 (0x20)	R/W	Frequency synthesizer calibration result register. Fast frequency hopping without calibration for each hop can be done by calibrating upfront for each frequency and saving the resulting FSCAL3, FSCAL2 and FSCAL1 register values. Between each frequency hop, calibration can be replaced by writing the FSCAL3, FSCAL2 and FSCAL1 register values corresponding to the next RF frequency.

0x26: FSCAL0 – Frequency synthesizer calibration

Bit	Field Name	Reset	R/W	Description
7	Reserved		R0	
6:5	Reserved	0 (00)	R	Defined on the transceiver version
4:0	FSCAL0[4:0]	13 (0x0D)	R/W	Frequency synthesizer calibration control. The value to use in register field is given by the SmartRF® Studio software.

0x29: FTEST – Frequency synthesizer calibration control

Bit	Field Name	Reset	R/W	Description
7:0	FTEST[7:0]	87 (0x57)	R/W	For test only. Do not write to this register.

0x2A: PTEST – Production test

Bit	Field Name	Reset	R/W	Description
7	PTEST[7:0]	127 (0x7F)	R/W	Writing 0xBF to this register makes the on-chip temperature sensor available in the IDLE state. The default 0x7F value should then be written back before leaving the IDLE state. Other use of this register is for test only.

0x2B: AGCTEST – AGC test

Bit	Field Name	Reset	R/W	Description
7:0	AGCTEST[7:0]	63 (0x3F)	R/W	For test only. Do not write to this register.

0x2C: TEST2 – Various test settings

Bit	Field Name	Reset	R/W	Description
7:0	TEST2[7:0]	152 (0x98)	R/W	For test only. Do not write to this register.

0x2D: TEST1 – Various test settings

Bit	Field Name	Reset	R/W	Description
7:0	TEST1[7:0]	49 (0x31)	R/W	For test only. Do not write to this register.

0x2E: TEST0 – Various test settings

Bit	Field Name	Reset	R/W	Description
7:0	TEST0[7:0]	11 (0x0B)	R/W	For test only. Do not write to this register.

0x38 (0xF8): PKTSTATUS – Current GDOx status

Bit	Field Name	Reset	R/W	Description	
7:2	Reserved		R0	Defined on the transceiver version	
1	GDO1		R	Current value on GDO1 pin	
0	GDO0		R	Current value on GDO0 pin	

0x39 (0xF9): VCO_VC_DAC – Current setting from PLL calibration module

Bit	Field Name	Reset	R/W	Description	
7:0	VCO_VC_DAC[7:0]		R	Status register for test only.	

0x3A (0xFA): TXBYTES – Underflow and number of bytes

Bit	Field Name	Reset	R/W	Description
7	TXFIFO_UNDERFLOW		R	
6:0	NUM_TXBYTES		R	Number of bytes in TX FIFO

34 Package Description (QLP 16)

All dimensions are in millimetres, angles in degrees. NOTE: The **CC2550** is available in RoHS lead-free package only.

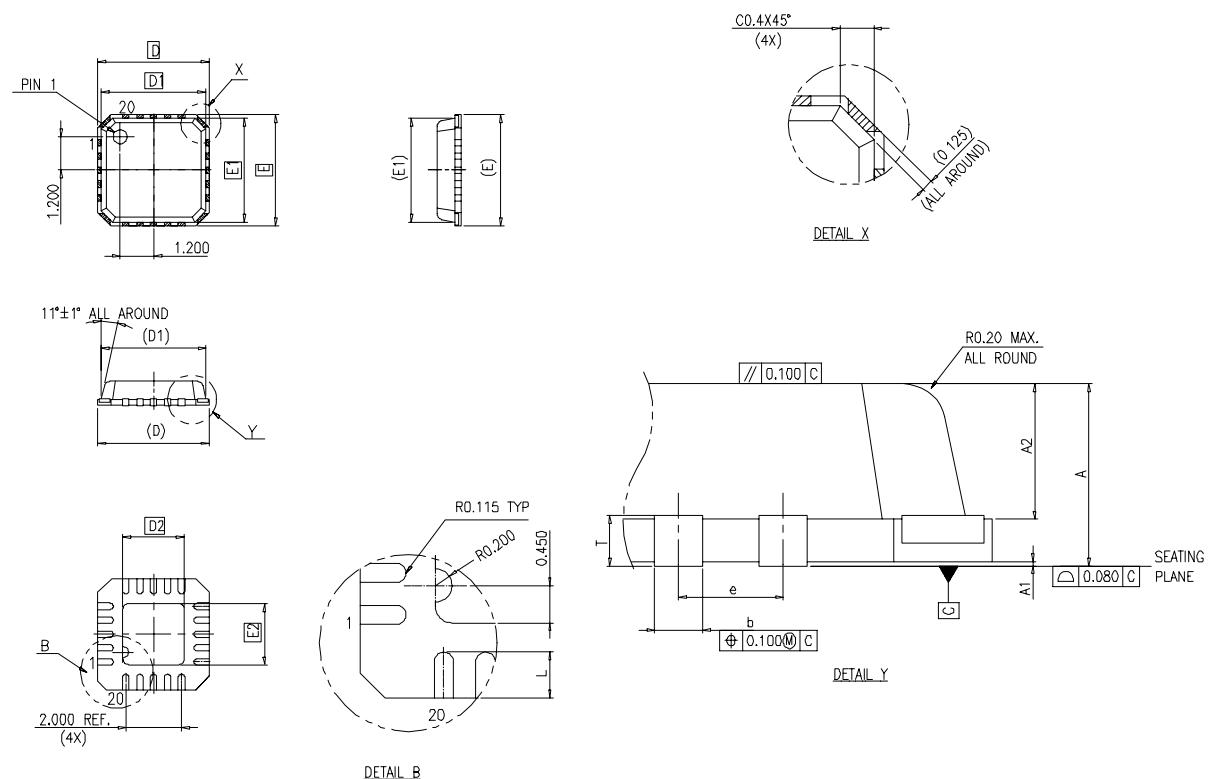

Figure 16: Package dimensions drawing (the actual package has 16 pins)

Package type		A	A1	A2	D	D1	D2	E	E1	E2	L	T	b	e
QLP 16 (4x4)	Min	0.75	0.005	0.55	3.90	3.65		3.90	3.65		0.45	0.190	0.23	
	Typ.	0.85	0.025	0.65	4.00	3.75	2.30	4.00	3.75	2.30	0.55		0.28	0.65
	Max	0.95	0.045	0.75	4.10	3.85		4.10	3.85		0.65	0.245	0.35	

Table 26: Package dimensions

34.1 Recommended PCB layout for package (QLP 16)

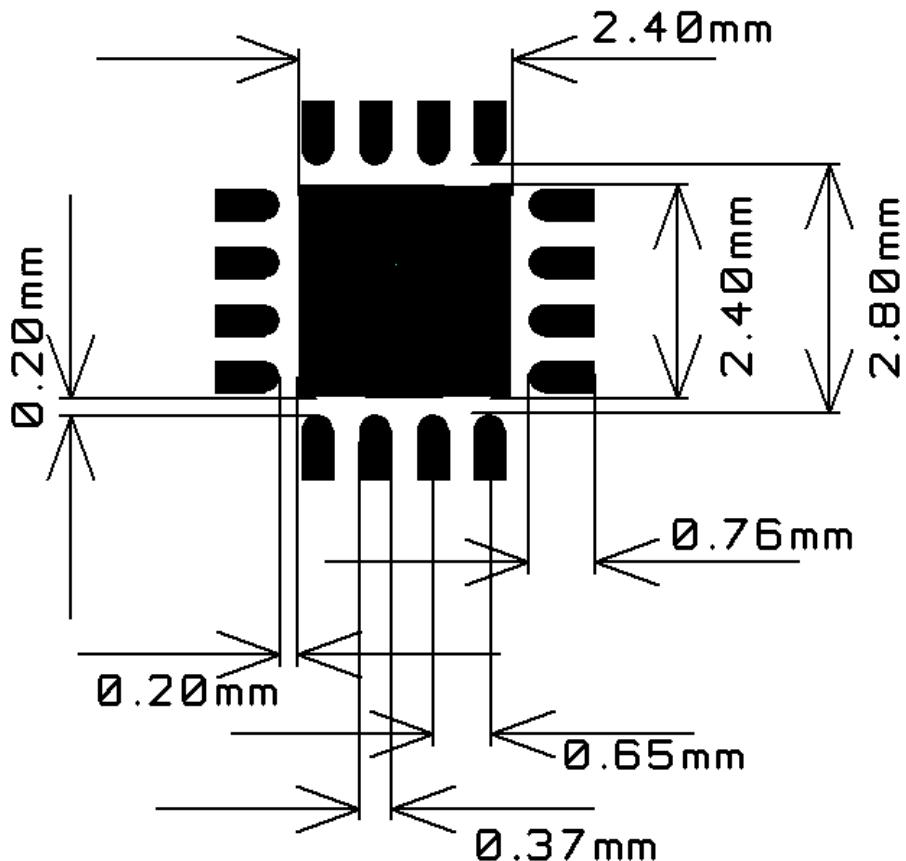

Figure 17: Recommended PCB layout for QLP 16 package

Note: The figure is an illustration only and not to scale. There are five TBD mil diameter via holes distributed symmetrically in the ground pad under the package. See also the [CC2550](#) EM reference design.

34.2 Package thermal properties

Thermal resistance	
Air velocity [m/s]	0
R _{th,j-a} [K/W]	TBD

Table 27: Thermal properties of QLP 16 package

34.3 Soldering information

The recommendations for lead-free reflow in IPC/JEDEC J-STD-020C should be followed.

34.4 Tray specification

CC2550 can be delivered in standard QLP 4x4mm shipping trays.

Tray Specification				
Package	Tray Width	Tray Height	Tray Length	Units per Tray
QLP 16	125.9mm	7.62mm	322.6mm	490

Table 28: Tray specification

34.5 Carrier tape and reel specification

Carrier tape and reel is in accordance with EIA Specification 481.

Tape and Reel Specification					
Package	Tape Width	Component Pitch	Hole Pitch	Reel Diameter	Units per Reel
QLP 16	TBD	TBD	TBD	13 inches	2500

Table 29: Carrier tape and reel specification

35 Ordering Information

Ordering part number	Description	Minimum Order Quantity (MOQ)
1169	<i>CC2550</i> - RTY1 QLP16 RoHS Pb-free 490/tray	490 (tray)
1250	<i>CC2550</i> - RTR1 QLP16 RoHS Pb-free 2500/T&R	2500 (tape and reel)

36.3 Disclaimer

Chipcon AS believes the information contained herein is correct and accurate at the time of this printing. However, Chipcon AS reserves the right to make changes to this product without notice. Chipcon AS does not assume any responsibility for the use of the described product; neither does it convey any license under its patent rights, or the rights of others. The latest updates are available at the Chipcon website or by contacting Chipcon directly.

As far as possible, major changes of product specifications and functionality, will be stated in product specific Errata Notes published at the Chipcon website. Customers are encouraged to sign up to the Developers Newsletter for the most recent updates on products and support tools.

When a product is discontinued this will be done according to Chipcon's procedure for obsolete products as described in Chipcon's Quality Manual. This includes informing about last-time-buy options. The Quality Manual can be downloaded from Chipcon's website.

Compliance with regulations is dependent on complete system performance. It is the customer's responsibility to ensure that the system complies with regulations.

36.4 Trademarks

SmartRF® is a registered trademark of Chipcon AS. SmartRF® is Chipcon's RF technology platform with RF library cells, modules and design expertise. Based on SmartRF® technology Chipcon develops standard component RF circuits as well as full custom ASICs based on customer requirements and this technology.

All other trademarks, registered trademarks and product names are the sole property of their respective owners.

36.5 Life Support Policy

This Chipcon product is not designed for use in life support appliances, devices, or other systems where malfunction can reasonably be expected to result in significant personal injury to the user, or as a critical component in any life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness. Chipcon AS customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Chipcon AS for any damages resulting from any improper use or sale.
