- Place of Tests: Nemko Korea Co., Ltd. EMC Site
- Test Report No.: NK-11-E-359

## INTRODUCTION

The measurement procedure described in American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9kHz to 40GHz (ANSI C63.4-2003) was used in determining radiated and conducted emissions emanating from **D&T Inc.**

FCC ID : **THCFS-S5501F, 55" Color TFT LCD Monitor for building-in.**

These measurement tests were conducted at **Nemko Korea Co., Ltd. EMC Laboratory.**

The site address is 67-1 & 300-2, Osan-Ri, Mohyeon-Myeon, Cheoin-Gu, Yongin-Si, Gyeonggi-Do, Korea

The area of Nemko Korea Corporation Ltd. EMC Test Site is located in a mountain area at 80 kilometers (48 miles) southeast and Incheon International Airport (Incheon Airport), 30 kilometers (18 miles) south-southeast from central Seoul.

It is located in the valley surrounded by mountains in all directions where ambient radio signal conditions are quiet and a favorable area to measure the radio frequency interference on open field test site for the computing and ISM devices manufactures.

The detailed description of the measurement facility was found to be in compliance with the requirements of § 2.948 according to ANSI C63.4 on 2003.

## EUT Information

Clock	27.00 MHz (Y1, Y2), 7.3728 MHz(Y3)
Chipset(s)	U29(ATmega88V-10AU), U10(IT6603),
	U14(K4H561638H-UCCC), U15(K4H561638H-UCCC),
	U7(THC63LVD1027), U4(CAT6353X)
LCD Panel Type	A-si TFT Active matrix
Screen size	138.8 cm (Diagonal)
Maximum Resolution	1920 x 1080 @ 60 Hz
Pixel pitch	0.63 (H) mm x 0.36 (V) mm
Display colors	16.7 M (RGB 8-bit data)
Contrast Ratio(Typ.)	4000:1
Viewing Angle(Typ.)	89/89/89/89
Response Time(Typ.)	10 ms
Luminance(Typ.)	350 cd/m2
Synchronization	Horizontal Frequency : 76.5 kHz
	Vertical Frequency : 60 Hz
Power Consumption	Maximum : 250 W
Port(s)	HDMI 1, HDMI 2, RS-232 Input, Speaker Input
Size and weight	1261.8 x 170 x 949 / 52 kg

## EUT System

Equipment	Model	Manufacturer	Serial Number
Panel	LTI550HJ05	Samsung Electronics or S-LCD	N/A
Main Board	LB506B Main Board	D&T Inc.	N/A
I/O Board	LB506B IO Board	D&T Inc.	N/A
SMPS	DT-PB260W	D&T Inc.	N/A

## Description of Test Modes

The EUT was pre-tested under the following resolutions mode:

1. 640 X 480 (60 Hz / 29.5 kHz) : Clock 23.625 MHz
2. 800 X 600 (60 Hz / 37 kHz) : Clock 35.5 MHz
3. 1280 X 1024 (60 Hz / 64 kHz) : Clock 108 MHz
4. 1600 X 1200 (60 Hz / 74 kHz) : Clock 130.375 MHz
5. 1920 X 1080 (60 Hz / 76.5 kHz) : Clock 148.5 MHz

The worst emission level was found when the EUT was tested under 1920 x 1080 resolution, therefore, the test data of this mode was recorded in the report.

## Setup Drawing

## SUMMARY OF TEST RESULTS

---

The EUT has been tested according to the following specification:

Name of Test	Paragraph No.	Result	Remark
Conducted Emission	15.107(a)	Complies	
Radiated Emission	15.109(g)	Complies	Below 1 GHz
Radiated Emission	15.109(a)	Complies	Above 1 GHz

## RECOMMENDATION/CONCLUSION

---

The data collected shows that the **D&T Inc.**

**FCC ID : THCF-S5501F, 55" Color TFT LCD Monitor for building-in.**

The highest emission observed was at **0.73 MHz** for conducted emissions with a A.V margin of **6.1 dB**, at **742.56 MHz** for radiated emissions with a margin of **6.5 dB**.

## SAMPLE CALCULATION

---

$$\text{dB } \mu\text{V} = 20 \log_{10} (\mu\text{V}/\text{m})$$

$$\mu\text{V} = 10^{(\text{dB } \mu\text{V}/20)}$$

### EX. 1.

@165.0 MHz

Class B limit = 30.0 dB  $\mu\text{V}/\text{m}$

Reading = 38.2 dB  $\mu\text{V}$  (calibrated level)

Antenna factor + Cable Loss + Amplifier Gain = -12.9 dB

Total = 25.30 dB  $\mu\text{V}/\text{m}$

Margin = 30.0 - 25.30 = 4.70

4.70 dB below the limit

## DESCRIPTION OF TESTS

### Conducted Emissions

The Line conducted emission test facility is located inside a 4 x 7 x 2.5 m shielded enclosure.

It is manufactured by EM engineering. The shielding effectiveness of the shielded room is in accordance with MIL-STD-285 or NSA 65-6.

A 1 m x 1.5 m wooden table 0.8 m height is placed 0.4 m away from the vertical wall and 0.5 m away from the side of wall of the shielded room

Rohde & Schwarz (ESH2-Z5) and Rohde & Schwarz (ESH3-Z5) of the 50 ohm / 50 uH Line Impedance Stabilization Network(LISN) are bonded to the shielded room.

The EUT is powered from the Rohde & Schwarz (ESH3-Z5) LISN and the support equipment is powered from the Rohde & Schwarz (ESH2-Z5) LISN.

Power to the LISN s are filtered by high-current high insertion loss power line filters.

The purpose of filter is to attenuate ambient signal interference and this filter is also bonded to shielded enclosure. All electrical cables are shielded by tinned copper zipper tubing with inner diameter of 1 / 2 ".

If d.c. power device, power will be derived from the source power supply it normally will be powered from and this supply lines will be connected to the LISNs,

All interconnecting cables more than 1 m were shortened by non inductive bundling (serpentine fashion) to a 1 m length.

Sufficient time for EUT, support equipment, and test equipment was allowed in order for them to warm up to their normal operating condition. The RF output of the LISN was connected to the spectrum analyzer to determine the frequency producing the maximum EME from the EUT. The spectrum was scanned from 150 kHz to 30 MHz with 20 ms sweep time.

The frequency producing the maximum level was re-examined using the EMI test receiver. (Rohde & Schwarz ESCS30).

The detector functions were set to CISPR quasi-peak mode & average mode.

The bandwidth of receiver was set to 9 kHz. The EUT, support equipment, and interconnecting cables were arranged and manipulated to maximize each EME emission.

Each emission was maximized by; switching power lines; varying the mode of operation or resolution; clock or data exchange speed; scrolling H pattern to the EUT and of support equipment, and powering the monitor from the floor mounted outlet box and computer aux a.c. outlet, if applicable; which ever determined the worst case emission.

Each EME reported was calibrated using the R&S signal generator.

Fig. 2. LISN Schematic Diagram

## DESCRIPTION OF TESTS

### Radiated Emissions

Preliminary measurement were made indoors at 3 meter using broad band antennas, broadband amplifier, and spectrum analyzer to determine the frequency producing the maximum EME. Appropriate precaution was taken to ensure that all EME from the EUT were maximized and investigated. The Technology configuration, clock speed, mode of operation or video resolution, turntable azimuth with respect to the antenna was note for each frequency found. The spectrum was scanned from 30 to 1000 MHz using Biconical log Antenna(ARA, LPB-2520/A). Above 1 GHz, Horn Antenna (SCHWARTZBECK, BBHA9120A) was used. Final Measurements were made outdoors at 10 m test range using Trilog-Broadband Antenna (Shwarzbeck, VULB9168) and Above 1 GHz, at 3 m test range using a Horn Antenna(SCHWARTZBECK, BBHA9120A) in fully anechoic chamber.

The test equipment was placed on a wooden table.

Sufficient time for the EUT, support equipment, and test equipment was allowed in order for them to warm up to their normal operating condition.

Each frequency found during pre-scan measurements was reexamined and investigated using EMI test receiver. (ESCS30) & (FSP40)

The detector function were set to CISPR quasi-peak and peak mode and the bandwidth of the receiver were set to 120 kHz and 1MHz depending on the frequency or type of signal.

The half wave dipole antenna was tuned to the frequency found during preliminary radiated measurements.

The EUT support equipment and interconnecting cables were re configured to the setup producing the maximum emission for the frequency and were placed on top of a 0.8 m high non- metallic 1.0 x 1.5 meter table.

The EUT, support equipment and interconnecting cables were re-arranged and manipulated to maximize each EME emission.

The turn table containing the Technology was rotated; the antenna height was varied 1 to 4 meter and stopped at the azimuth or height producing the maximum emission. Each emission was maximized by : switching power lines; varying the mode of operation or resolution; clock or data exchange speed; scrolling H pattern to the EUT and of support equipment, and powering the monitor from the floor mounted outlet box and computer aux a.c. outlet, if applicable; which ever determined the worst case emission.

Each EME reported was calibrated using the R/S signal generator.
