1.7 TEST RESULTS

The requirements of this test document are fulfilled by the equipment under test. The complete test results
 are presented in the following.

2 TECHNICAL DATA OF EQUIPMENT

2.1 DEVICE UNDER TEST

Type of equipment:	UHF-Synthesizer Transceiver
Type designation:	SR-450 Smart-Radio
Operating frequency range:	410 MHz to 470 MHz
Transmitter output power:	6 W / +37.8 dBm
Channel spacing:	12.5 kHz / 25 kHz

* declared by the applicant

The following external I/O cables were used:

Cable	Length	Shielding	Connector
DC-power-supply	1.5 m	no	Not specified
Bit Pattern Generator	1.5 m	yes	BNC

2.2 PERIPHERY DEVICES

The ancillary equipment mentioned below was in use:

The EUT (transmitter) was powered with an external DC-power supply.
A Bit Pattern Generator "HP DATA ERROR ANALYSER 1645A" was used to generate a modulation signal.
A test board (delivered by the applicant) was used to fix the radio module and contact the periphery devices.

2.3 MODIFICATIONS

No modifications were necessary to fulfil the requirements.

3 TEST PROCEDURES

The test procedures were performed as follows (according to TIA/EIA-603-C (17 August 2004)).

3.1 Power Output at Terminals FCC 2.1046, FCC 90.205

The conducted RF output power is the available power at the output terminals of the transmitter when the output terminals are connected to the standard transmitter load. The test sample is connected to a radio communication analyser. The power output at the transmitter antenna port is determined by adding the value of the cable loss to the power reading. The test are performed at the frequencies as shown in chapter 4 of this Test Report with full rated power level of the transmitter.

3.2 Occupied Bandwidth FCC 2.1049, 90.210

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission. The transmitter is modulated by a 2400 bits/s signal.

The modulation amplitude was 775 mV.

Emission Mask C was used for the transmitter designed to operate with a 25 kHz bandwidth and Emission Mask D for the transmitter designed to operate with a 12.5 kHz bandwidth.

3.3 Spurious Emissions at Antenna Terminals FCC 2.1051

Conducted spurious emissions are emissions at the antenna terminal on frequencies outside the operating band. In order to suppress inter-modulation products in the spectrum analyser a notch filter is used (if applicable). The test is performed according the principle below:

3.4 Radiated Spurious Emissions FCC 2.1053, FCC 90.210

Radiated spurious emissions are emissions from the EUT when transmitting in non-radiating load on frequencies outside the operating band. ERP-Measurement of spurious emission were done to the general substitution method. In order to suppress inter-modulation products in the spectrum analyser a notch filter is used (if applicable).

3.5 Frequency Stability with Temperature Variation FCC 2.1055, FCC 90.213

The carrier frequency is the stability of the transmitter to maintain an assigned carrier frequency. The frequency stability was measured with variation of ambient temperature from -30°C to+ 50°C and variation of the primary voltage.

3.6 Frequency Stability with Primary Voltage Variation FCC 2.1055, FCC 90.213

The carrier frequency is the stability of the transmitter to maintain an assigned carrier frequency.

The frequency stability was measured with variation of the primary voltage.

3.7 Transmitter transient frequency behaviour FCC 90.214

Transient frequency behaviour is a measure of the difference, as a function in time, of the actual transmitter frequency to the assigned transmitter frequency behaviour during the switch on and switch off time.

4 OPERATIONAL STATES AND PHYSICAL BOUNDARIES

The EUT was powered with 5 V DC (RF-module) and 9 V DC (RF-amplifier) by 2 external power supplies.

The test signals to modulate the EUT and/or to measure the bit error rate (BER) were generated and measured with an "HP DATA ERROR ANALYSER 1645A". All tests were done with 2400 bits/s.

The modulation amplitude was 775 mV.

All test "under extreme conditions" were done with variation of the 5 V DC (RF-module) and 9 V DC (RF-amplifier) supply voltage.

The "frequency stability", "carrier power conducted" and "transient behaviour" were measured without modulation. All other tests were done with modulation.

The Occupied Bandwidth was measured in 12.5 kHz and 25 kHz-Mode.

The spurious emission measurement was done in 25 kHz-Mode only, because pretests have shown that this mode is the worst case.

The tests were performed at the lowest, middle and highest frequency of the equipment under test as defined below:

Channel:	Transmit frequency:
1	410.025 MHz
2	440.025 MHz
3	469.975 MHz

The physical boundaries of the Equipment Under Test are shown below.
