# Report on the Radio Testing of:

## **BEOREMOTE HALO TABLE**

Model: 3054

In accordance with 47 CFR FCC Part 15E

Prepared for: Bang & Olufsen a/s Bang og Olufsen Allé 1, Struer, 7600 Denmark

## **COMMERCIAL-IN-CONFIDENCE**

Document Number: 7191217919-EEC19/17 | Issue: 01

FCC ID: TTU-HALOTABLE

| RESPONSIBLE FOR      | NAME           | DATE        | SIGNATURE |

| Authorised Signatory | Quek Keng Huat | 02 Oct 2019 |           |

**EXECUTIVE SUMMARY** 

A sample of this product was tested and found to be compliant with the mentioned standard(s).

LA-2007-0380-A LA-2007-0385-E LA-2007-0381-F LA-2007-0386-C LA-2007-0382-B LA-2010-0464-D LA-2007-0384-G LA-2018-0703-G LA-2017-0384-G LA-2018-0703-G The results reported herein have been performed in accordance with the terms of accreditation under the Singapore Accreditation Council.

Inspections/Calibrations/Tests marked "Not SAC-SINGLAS Accredited" in this Report are not included in the SAC-SINGLAS Accreditation Schedule for our inspection body/laboratory.

FCC ID: TTU-HALOTABLE COMMERCIAL-IN-CONFIDENCE

#### **Notes**

- 1. The EUT is a Class B device when in non-transmitting state and meets the 47 CFR FCC Part15B Class B requirements.
- 2. The WLAN module of the Equipment Under Test (EUT) is a FCC certified module. The module was integrated into the main board without modifications in hardware nor firmware. Refer to FCC Grant bearing FCC ID: VPYLBEE59B1LV for details.
- 3. The WLAN module of the Equipment Under Test (EUT) is a FCC certified module. The module was integrated into the main board without modifications in hardware nor firmware. As such, the Dynamic Frequency Selection (DFS) of the EUT is deemed to meet the requirement of FCC 15.407(h), (i) without testing.
- 4. The EUT was operated in continuous transmission, ie 100% duty cycle.

|  | FCC ID: EJE-WB0001            |   |
| Fujitsu AC Adaptor                           | M/N: CP311808-01              | 1.80m unshielded power cable                    |
|  | S/N: 08903690B                |   |
|  | FCC ID: DoC                   |   |

## 2 Test Details

## 2.1 Conducted Emissions

## 2.1.1 Test Limits

| Frequency Range | Limit Value      | es (dBμV)    |
|-----------------|------------------|--------------|
| (MHz)           | Quasi-peak (Q-P) | Average (AV) |
| 0.15 - 0.5      | 66 – 56 *        | 56 – 46 *    |
| 0.5 - 5.0       | 56               | 46           |
| 5.0 - 30.0      | 60               | 50           |

FCC ID: TTU-HALOTABLE COMMERCIAL-IN-CONFIDENCE

### 2.1.2 Test Setup

- 2.1.2.1 The EUT and supporting equipment were set up in accordance with the requirements of the standard as shown in the setup photos.
- 2.1.2.2 The power supply for the EUT was fed through a  $50\Omega/50\mu H$  EUT LISN, connected to filtered mains.
- 2.1.2.3 The RF OUT of the EUT LISN was connected to the EMI test receiver via a low-loss coaxial cable.
- 2.1.2.4 All other supporting equipment were powered separately from another LISN.

#### 2.1.3 Test Method

- 2.1.3.1 The EUT was switched on and allowed to warm up to its normal operating condition.
- 2.1.3.2 A scan was made on the NEUTRAL line over the required frequency range using an EMI test receiver.
- 2.1.3.3 High peaks, relative to the limit line, were then selected.
- 2.1.3.4 The EMI test receiver was then tuned to the selected frequencies and the necessary measurements made with a receiver bandwidth setting of 9kHz. Both Quasi-peak and Average measurements were made.
- 2.1.3.5 The measurements were then repeated for the LIVE line.

#### Sample Calculation Example

At 20 MHz

Q-P limit =  $60.0 \text{ dB}\mu\text{V}$ 

Transducer factor of LISN, pulse limiter & cable loss at 20 MHz = 11.2 dB

Q-P reading obtained directly from EMI Receiver = 40.0 dB<sub>µ</sub>V

(Calibrated for system losses)

Therefore, Q-P margin = 60.0 - 40.0 = 20.0

i.e. 20.0 dB below Q-P limit

FCC ID: TTU-HALOTABLE COMMERCIAL-IN-CONFIDENCE

## 2.1.4 Test Results

| Test Input Power                  | 120V 60Hz | Temperature          | 24°C          |

## <u>Notes</u>

| 1. | All possible modes of operation were investigated from 150kHz to 30MHz. Only the worst case emissions measured, using the correct CISPR detectors, are reported. All other emissions were relatively insignificant. |
|----|---|
| 2. | A "positive margin" indicates a PASS as it refers to the margin present below the limit line at the particular frequency. Conversely, a "negative margin" indicates a FAIL.   |
| 3. | EMI receiver Resolution Bandwidth (RBW) and Video Bandwidth (VBW) settings:  9kHz - 30MHz  RBW: 9kHz  VBW: 30kHz  |

## 2.2 Radiated Emissions (Spurious Emissions Inclusive Restricted Bands Requirement)

#### 2.2.1 Test Limits

| Frequency Range (MHz) | Quasi-Peak Limit Values (dBµV/m) |
|-----------------------|----------------------------------|
| 0.009 - 0.490 *       | 20 log [2400 / F (kHz)] @ 300m   |
| 0.490 - 1.705         | 20 log [24000 / F (kHz)] @ 30m   |
| 1.705 - 30.0          | 30.0 @ 30m                       |
| 30 – 88               | 40.0 @ 3m                        |
| 88 – 216              | 43.5 @ 3m                        |
| 216 – 960             | 46.0 @ 3m                        |
| Above 960 *           | 54.0 @ 3m                        |

<sup>\*</sup> For frequency bands 9kHz - 90kHz, 110kHz - 490kHz and above 1GHz, average detector was used. A peak limit of 20dB above the average limit does apply.

FCC ID: TTU-HALOTABLE COMMERCIAL-IN-CONFIDENCE

#### 2.2.2 Test Setup

- 2.2.2.1 The EUT and supporting equipment were set up in accordance with the requirements of the standard as shown in the setup photos.
- 2.2.2.2 The filtered power supply for the EUT and supporting equipment were tapped from the appropriate power sockets located on the turntable.
- 2.2.2.3 The relevant broadband antenna was set at the required test distance away from the EUT and supporting equipment boundary.

#### 2.2.3 Test Method

- 2.2.3.1 The EUT was switched on and allowed to warm up to its normal operating condition.
- 2.2.3.2 A prescan was carried out to pick the worst emission frequencies from the EUT. For EUT which is a portable device, the prescan was carried out by rotating the EUT through three orthogonal axes to determine which altitude and equipment arrangement produces such emissions.
- 2.2.3.3 The test was carried out at the selected frequency points obtained from the pre-scan. Maximization of the emissions, was carried out by rotating the EUT, changing the antenna polarization, and adjusting the antenna height in the following manner:
  - a. Vertical or horizontal polarisation (whichever gave the higher emission level over a full rotation of the EUT) was chosen.
  - b. The EUT was then rotated to the direction that gave the maximum emission.
  - c. Finally, the antenna height was adjusted to the height that gave the maximum emission
- 2.2.3.4 A Quasi-peak measurement was made for that frequency point if it was less than or equal to 1GHz.For frequency point in range of 9kHz 90kHz, 110kHz 49k0kHz and above 1GHz, both Peak and Average measurements were carried out.
- 2.2.3.5 The measurements were repeated for the next frequency point, until all selected frequency points were measured.
- 2.2.3.6 The frequency range covered was from the lowest radio frequency signal generated from the EUT, without going below 9kHz to 10<sup>th</sup> harmonics of the EUT fundamental frequency, using the loop antenna for frequency below 30MHz, Bi-log antenna for frequencies from 30MHz up to 1GHz, and the Horn antenna above 1GHz.

#### **Sample Calculation Example**

At 300 MHz Q-P limit =  $46.0 \text{ dB}_{\mu}\text{V/m}$ 

Log-periodic antenna factor & cable loss at 300 MHz = 18.5 dB Q-P reading obtained directly from EMI Receiver =  $40.0 \text{ dB}_{\mu}\text{V/m}$  (Calibrated level including antenna factors & cable losses)

Therefore, Q-P margin = 46.0 - 40.0 = 6.0 i.e. 6.0 dB below Q-P limit

Document Number: 7191217919-EEC19/17 | Issue: 01 FCC ID: TTU-HALOTABLE COMMERCIAL-IN-CONFIDENCE

## <u>Notes</u>

| 1. | All possible modes of operation were investigated. Only the worst case emissions measured, using the correct CISPR detectors, are reported. All other emissions were relatively insignificant.  |
|----|---|
| 2. | "" indicates no emissions were found and shows compliance to the limits   |
| 3. | The measurement was done at 3m. The measured results were extrapolated to the specified test limits as specified in RSS-GEN 6.4 based on 40dB/decade.   |
| 4. | Quasi-peak measurement was used for frequency measurement up to 1GHz. Average and peak measurements were used for emissions above 1GHz. The average measurement was done by averaging over a complete cycle of the pulse train, including the blanking interval as the pulse train duration does not exceed 0.1 second. |
| 5. | A "positive margin" indicates a PASS as it refers to the margin present below the limit line at the particular frequency. Conversely, a "negative margin" indicates a FAIL.   |
| 6. | EMI receiver Resolution Bandwidth (RBW) and Video Bandwidth (VBW) settings:  30MHz - 1GHz RBW: 120kHz VBW: 1MHz  >1GHz RBW: 1MHz VBW: 3MHz  |
| 7. | The upper frequency of radiated emission investigations was according to requirements stated in Section 15.33 (a) for intentional radiators & Section 15.33 (b) for unintentional radiators.  |
| 8. | The channel in the table refers to the transmit channel of the EUT.   |

FCC ID: TTU-HALOTABLE COMMERCIAL-IN-CONFIDENCE

#### 2.3 Band Edge Compliance (Radiated)

#### 2.3.1 Test Limits

The EUT shows compliance to the requirements of this section, which states in any 100kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator (EUT) is operating, the radio frequency power that is produced by the EUT shall be at least 20dB below that in the 100kHz bandwidth within the band that contains the highest level of the desired power. In addition, radiated emissions which fall in the restricted bands shall comply to the radiated emission limits specified in 15.209.

#### 2.3.2 Test Setup

- 2.3.2.1 The EUT and supporting equipment were set up as shown in the setup photo.
- 2.3.2.2 The power supply for the EUT was connected to a filtered mains.
- 2.3.2.3 The resolution bandwidth (RBW) and the video bandwidth (VBW) of the spectrum analyser were respectively set to 100kHz and 300kHz to show compliance of spurious at band edges are at least 20dB below the carriers. For restricted band spurious at band edges, peak and average measurement plots were taken using the following setting:
  - a. Peak Plot: RBW = 1MHz, VBW = 3RBWb. Average Plot
  - b. Average Plot RBW = 1MHz, VBW = 10Hz
- 2.3.2.4 All other supporting equipment were powered separately from another filtered mains.

#### 2.3.3 Test Method

- 2.3.3.1 The EUT was switched on and allowed to warm up to its normal operating condition. The EUT was then configured to operate in the test mode.
- 2.3.3.2 The frequency span of the spectrum analyser was set to wide enough to capture the upper band edge of the transmission band, 5.1500GHz and any spurious emissions at the band edge.
- 2.3.3.3 The spectrum analyser was set to max hold to capture any spurious emissions within the span. The signal capturing was continuous until no further spurious emissions were detected.
- 2.3.3.4 The measurements were repeated if the EUT supports more than one modulation and data rate.
- 2.3.3.5 The measurements were repeated with the frequency span of the spectrum analyser was set to wide enough to capture the lower band edge frequency of the transmission band, 5.3500GHz and the any spurious emissions at the band-edge.
- 2.3.3.6 The measurements were repeated with the frequency span of the spectrum analyser was set to wide enough to capture the upper band edge frequency of the transmission band, 5.4600GHz and the any spurious emissions at the band-edge.

#### 2.4 Maximum Conducted Output Power

#### 2.4.1 Test Limits

The EUT shows compliance to the requirements of this section, which states the EUT shall not exceed 250mW in bands UNII-1, UNII-2A, UNII-2C. For the EUT operating in UNII-3 band, the maximum conducted output power shall not greater than 1W.

#### 2.4.2 Test Setup

- 2.4.2.1 The EUT and supporting equipment were set up as shown in the setup photo.
- 2.4.2.2 The power supply for the EUT was connected to a filtered mains.
- 2.4.2.3 The RF antenna connector was connected to a power meter via a low-loss coaxial cable.
- 2.4.2.4 All other supporting equipment were powered separately from another filtered mains.

#### 2.4.3 Test Method

- 2.4.3.1 The EUT was switched on and allowed to warm up to its normal operating condition. The EUT was then configured to operate in the test mode, non-hopping with transmitting frequency at lower channel.
- 2.4.3.2 The maximum peak power of the transmitting frequency was detected and recorded.
- 2.4.3.3 The measurement were repeated with the transmitting frequency was set to middle channel and upper channel respectively.

FCC ID: TTU-HALOTABLE COMMERCIAL-IN-CONFIDENCE

#### 2.5.2 Test Setup

- 2.5.2.1 The EUT and supporting equipment were set up as shown on the setup photo.
- 2.5.2.2 The relevant field probe was positioned at least 20cm away from the EUT and supporting equipment boundary.

#### 2.5.3 Test Method

- 2.5.3.1 . The EUT was switched on and allowed to warm up to its normal operating condition.
- 2.5.3.2 The test was first carried out at one of the positions / sides of the EUT.
- 2.5.3.3 Power density measurement (mW/cm²) was made using the field meter set to the required averaging time.
- 2.5.3.4 Measurements were repeated for the next position and its associate EUT operating mode, until all possible positions and modes were measured.

## **Sample Calculation Example**

At 2400 MHz, limit = 1.0 mW/cm<sup>2</sup>

Power density reading obtained directly from field meter = 0.3 mW/cm<sup>2</sup> averaged over the required 30 minutes.

Therefore, margin =  $0.3 - 1.0 = -0.7 \text{ mW/cm}^2$ 

i.e. 0.7 mW/cm<sup>2</sup> below limit

#### 2.5.4 Test Results

| Test Input Power | 120V 60Hz | Temperature          | 24°C        |
|------------------|-----------|----------------------|-------------|
| Test Distance    | 20cm      | Relative Humidity    | 60%         |
|                  |           | Atmospheric Pressure | 1030mbar    |
|                  |           | Tested By            | Anthony Toh |
|                  |           | Test Date            | 18 Sep 2019 |

Document Number: 7191217919-EEC19/17 | Issue: 01 FCC ID: TTU-HALOTABLE COMMERCIAL-IN-CONFIDENCE

## <u>Notes</u>

| 1. | All possible modes of operation were investigated. Only the worst case highest radiation levels were measured. Measurements were taken at the required averaging time. All other radiation levels were relatively insignificant. |
|----|--|
| 2. | A "positive margin" indicates a PASS as it refers to the margin present below the limit line at the particular frequency. Conversely, a "negative margin" indicates a FAIL.  |

# **5** Measurement Uncertainty

All test measurements carried out are traceable to national standards. The uncertainty of the measurement at a confidence level of approximately 95%, with a coverage factor of 2.

| Test Name                    | Measurement Uncertainty  |
|------------------------------|--|
| Conducted Emissions          | 9kHz to 30MHz, ±2.4dB  |
| Radiated Emissions           | 9kHz to 30MHz @ 10m, ±2.3dB<br>30MHz to 1GHz @ 10m, ±4.0dB<br>30MHz to 1GHz @ 3m, ±5.6dB<br>>1GHz to 40GHz @3m, ±5.0dB |
| Maximum Permissible Exposure | 0.1MHz – 3GHz is ±15.0%  |

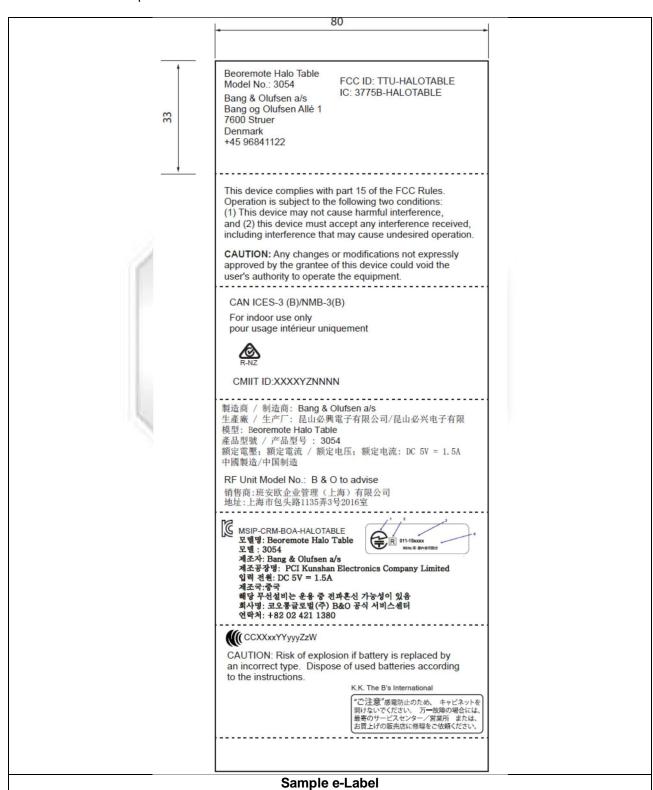

## 6 Annex A – FCC Label and Position

Labelling requirements per Section 2.925 & 15.19

The label shown will be permanently affixed at a conspicuous location on the device and be readily visible to the user at the time of purchase.

FCC ID: TTU-HALOTABLE COMMERCIAL-IN-CONFIDENCE

Please note that this Report is issued under the following terms:

- 1. This report applies to the sample of the specific product/equipment given at the time of its testing/calibration. The results are not used to indicate or imply that they are applicable to other similar items. In addition, such results must not be used to indicate or imply that TÜV SÜD PSB approves, recommends or endorses the manufacturer, supplier or user of such product/equipment, or that TÜV SÜD PSB in any way "guarantees" the later performance of the product/equipment. Unless otherwise stated in this report, no tests were conducted to determine long term effects of using the specific product/equipment.
- The sample/s mentioned in this report is/are submitted/supplied/manufactured by the Client. TÜV SÜD PSB therefore assumes no responsibility for the accuracy of information on the brand name, model number, origin of manufacture, consignment or any information supplied.
- 3. Nothing in this report shall be interpreted to mean that TÜV SÜD PSB has verified or ascertained any endorsement or marks from any other testing authority or bodies that may be found on that sample.
- 4. This report shall not be reproduced wholly or in parts and no reference shall be made by the Client to TÜV SÜD PSB or to the report or results furnished by TÜV SÜD PSB in any advertisements or sales promotion.
- 5. Unless otherwise stated, the tests were carried out in TÜV SÜD PSB Pte Ltd, No.1 Science Park Drive Singapore 118221.
