

RF Exposure / MPE information

Based on the fact that the module is intended for use only in mobile devices (not portable) the requirements are met without the need for MPE calculation.

The transmitter is 2.4GHz; the 1500 - 100000 MHz exposure limit is 1.0mW/cm² which equates to 5Watts @ 20cm distance. Therefore the unit must be compliant without need for calculation as the output power limit is only 1Watt. The actual device in question is much less than that at 0.1W maximum.
