## CONFIRMATION STATEMENT

**DATE : April 04, 2007**

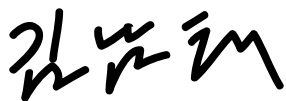

**Federal Communications Commission  
Authorization and Evaluation Division  
7435 Oakland Mills Road  
Columbia, MD 21046**

To Whom It May Concern:

We confirm that the model no.GMRS7015RC (FCC ID : U32GMRS7015) does not have a capability of tuning the frequencies assigned or readily being altered by the user to operate to the Domestic public Cellular Radio Telecommunications Service in part 15.121 of the Commission's Rules.

In this circuitry, the frequency generation is PLL type so that the frequencies shall be tuned and controlled by the CPU. The used CPU also does not have a capability to cover the cellular frequencies. Even if CPU is change to receive the cellular frequencies, the VCO cannot cover the cellular frequencies. Also the CPU is a die bonded and wired to the PC board and "hardened" with a black epoxy that covers the CPU, it is impossible user to modify or change the CPU. Therefore this unit still remains the state in which the unit cannot receive any cellular frequencies. This is to certify that the conditions mandated in part 15.121 have been met.

Sincerely,

N.T.KIM / Managing Director
