

## **Y1226 operation description**

1. Press the button, the MCU will wake up and start work. It will work according to the instruction of the button, including to turn on the LED light and transmit radio signal through ASK 433.9MHz.

2. When the pressing time of the button exceeds the initialization or the time of no pressing button signal exceeds the initialization, MCU will stop working and enter into a state of sleeping in order to reduce energy consumption.
