For test instruments and accessories used see section 6 Part **CPC 3**.

5.4.1 Description of the test location

Test location: AREA4

5.4.2 Photo documentation of the test set-up

5.4.3 Applicable standard

5.4.4 Description of Measurement

The maximum total power input to the antenna has been measured conducted as described in clause 5.3 of this document. Through the Friis transmission formula, which is a far field assumption and the known maximum gain of the antenna, the maximum MPE at a defined distance away from the product, can be calculated.

$$\text{Friis transmission formula: } P_d = \frac{P_{out} * G}{4 * \pi * r^2}$$

where

P_d = power density in mW/cm^2

P_{out} = output power to antenna in mW

G = gain of antenna (linear scale)

r = distance between antenna and observation point (cm)

5.4.6 Compliance regarding Co-location and Co-transmission

Applicable standard: ANSI/IEEE C95.1-1999, "IEEE Standard for Safety Levels with respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz", Clause 4.1.1. e):

For mixed or broadband fields at a number of frequencies for which there are different values of the MPE, the fraction of the MPE (in terms of E, H, or power density (S)) occurred within each frequency interval should be determined and the sum of all such fractions should not exceed unity (1.0, or 100 % in terms of percentage).

1. MPE of WLAN-Module: $P_d = 0.026 \text{ mW/cm}^2$
Limit: 1 mW/cm^2
Fraction of MPE: 2.6 %

2. MPE of RFID Module: The fieldstrength radiated by the RFID Module is too small to be considered.

The requirements are **FULFILLED**.

Remarks: The MPE limit is reached at 1.72 cm or further to the transmitting antenna. Because the antenna is inside the MP and its diameter is 30 cm, no RF exposure warnings will be used with the EuT.
