

## **ZG-7600H-P User Manual**

## Copyright

There is no any clear or implicit assurance in the user's manual of our company, including the assurance of selling or installing for the special purpose. There are rival's volumes to carry on the power to alter or revise in our company, if alter and forgive me for not issuing a separate notice. You can't duplicate any content of this manual by the written permission of our company.

## About the manual

The purpose to use this manual is for install the wireless Access Point. This manual is including disposing course and method and helping the customer to solve the unpredictable problem.

The following typographical conventions are used in this purpose:

**Class B:**

### FEDERAL COMMUNICATIONS COMMISSION INTERFERENCE STATEMENT

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/ TV technician for help.

**CAUTION:**

Any changes or modifications not expressly approved by the grantee of this device could void the user's authority to operate the equipment.

**RF exposure warning .**

This equipment must be installed and operated in accordance with provided instructions and the antenna(s) used for this transmitter must be installed to provide a separation distance of at least 20 cm from all persons and must not be co-located or operating in conjunction with any other antenna or transmitter. End-users and installers must be provided with antenna installation instructions and transmitter operating conditions for satisfying RF exposure compliance.

**Bold:** Indicates the function, important words, and so on.

# Chapter 1 Introduction

## Introduction to Product

ZG-7600H-P, a 4-in-1 SMB High Power WLAN Access Point, support PoE, 200mW Output Power, can be operated in one of the following 4 modes, except general access point, also include AP client, repeater and point to point bridge.

The 802.11g-compatible device delivers a 54Mbps high-speed, reliable and easy-to-use wireless connection throughout your home or small office at an affordable price. By connecting the device to your wired network, users can enjoy wireless Internet access faster than ever before. Meanwhile, robust security ensures the Internet connection is protected.

See its panel as follow picture.

**Figure 1 Product Panel**

## LED and Port Definition

The detail definition follows the underside tables:

**Diagram 1 LED and Port Definition**

LED	Description
POWER	Green ON: Power ON (Successful reboot) Blinking: Device is not ready or system booting
LAN	Green ON : 10M connection Amber ON : 100M connection Blinking: Sending/receiving data

WLAN	Blinking : Data TX/RX through wireless access point
Port	Description
POWER	Reserved (DC 12v/0.83A )
Reset	Reboot- Press & release right away Restore- Press for 5 secs and then release
Ethernet	PoE

## **Chapter 2 Hardware Installation**

### **System Requirements**

1. A computer has a 10/100Base-TX Ethernet that is connected to the same IP segment as the AP.
2. The computer has one Web browser, such as Microsoft Internet Explorer 6.0.

# Chapter 3 Safely Use Your Device

## Safely Use in Installation

1. Please do not put Access Point near these places: electric power line, electric light, electricity or any places nearby strong electric power, otherwise it may make damage to Access Point.

## Safely Use in Management

Do not try to turn off the Access Point, shutdown the computer or do anything else to the Access Point until the Access Point finishes restarting!

# Chapter 4 Basic Configuration

## Default Settings

**Diagram 2 Default Settings**

Options	Default Value
User Name	admin
password	password
Device Name	APxxxxxx (xxxxxx indicate the last 6 MAC address of AP)
Country/Region	China
IP Address	IP Type: Fixed IP Address :192.168.0.228 Mask : 255.255.255.0 Gateway: 0.0.0.0
Operating Mode	AP Mode
Wireless Mode	Auto(11g/11b)
Channel/Frequency	6/2.437GHz
SSID	Wireless
Broadcast SSID	Yes
Beacon Interval	100
DTIM Interval	1
WMM Support	No
Number of Wireless Stations Allowed to Associate	32
Radio Enable	Yes
Output Power Management	Full
Preamble Type	Dynamic
Super-G Mode	Disable
Turbo-G Mode	Disable
RTS/CTS Threshold	2346
Fragmentation	2346
SNMP	Disable

## Using the Web Management

The Web Management provides you with a user-friendly graphical user interface. The Access Point allows you via web browser (MS Internet Explorer 6.0) to monitor and configure the device.

1. Run Web Explorer, Enter default IP Address: <http://192.168.0.228> in the Address field. And press Enter.

The image shows a login form with the following fields:

- User Name:** admin
- Password:** password
- Language:** English

At the bottom are two buttons: **Login** and **Cancel**.

Figure 2 login

2. Enter default Password (password), Click Login. The home page will show up.

**Status**

**Device Information**

Device Name:	APc94dcb
Operation Mode:	AP
Firmware Version:	1.0.16

**IP Settings**

IP Address:	192.168.0.228
Subnet Mask:	255.255.255.0
Gateway IP Address:	0.0.0.0

**Wireless Settings**

Channel:	6
MAC Filter:	Disable

**Security Profiles**

#	Profile Name	SSID	MAC	Security	VLAN	Status
1	Profile1	WirelessAP	00:60:b3:c9:4d:cb	Disable		Enable
2	Profile2	Wireless	06:60:b3:c9:4d:cb	Disable		Disable
3	Profile3	Wireless	0a:60:b3:c9:4d:cb	Disable		Disable
4	Profile4	Wireless	0e:60:b3:c9:4d:cb	Disable		Disable
5	Profile5	Wireless	12:60:b3:c9:4d:cb	Disable		Disable

Figure 3 Status Page

## System Setup

The screenshot shows the 'System' configuration page. It includes sections for 'Device Settings' (Device Name: APc94dcb), 'Country Settings' (Country / Region: China), and 'IP Address Assignment' (IP Address: 192.168.0.228, Subnet Mask: 255.255.255.0, Gateway IP Address: 0.0.0.0). The 'IP Address Assignment' section has two radio button options: 'Obtain IP Address Automatically' (unchecked) and 'Use Fixed IP Address' (checked). Buttons for 'Apply' and 'Reset' are at the bottom.

Figure 4 System Setup

### ● Device Name

This is the NetBIOS name of Access Point; you may modify the default name with a unique name up to 15 characters long including numbers from 0 to 9, letters (A-Z; a-z) and digraphs (-), the name supports WINS so you can ping Access Point using *ping Access Point Name* or use web browser to open web utility by inputting Access Point Name in the IE address.

### ● Country/Region

Select your country or region from the drop-down list. This field displays countries/regions of operation which might be not legal in other countries/regions.

### ● IP Address

There two IP type:

- Use Fixed IP Address: You should manually configure IP address, subnet mask, gateway
- Obtain IP Address Automatically: AP can get IP settings from DHCP Server.

## Wireless Settings

**Wireless Settings**

---

**Basic Settings**

Operation Mode	AP
SSID	<input type="button" value="Edit"/>
Channel	6
Wireless Mode	Auto (11g/11b)

---

**Advanced Settings**

Beacon Interval	100 (20-1000)
DTIM Interval	1 (1~255)
WMM	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Number of Wireless Stations Allowed to Associate	32 (1~32)
Radio Enable	<input checked="" type="radio"/> Yes <input type="radio"/> No
Output Power Management	Full
Data Rate Management	Best
Preamble Type	Dynamic
Super-G Mode	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Turbo-G Mode	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
RTS/CTS Threshold	2346 (0~2346)
Fragmentation	2346 (256~2346)
Flow Balance Mode	Disable
Flow Balance Group	Wireless

Figure 5 Wireless Settings

● **Operating Mode**

- AP: This mode is used to build cover with wireless network which allowing wireless device connection.
- Bridge: This mode is used to build point to point and point to multi point network which allowing other wireless bridge connection by wireless.
- AP + Reporter: This mode allows both cover with wireless network and wireless bridge connection by wireless.
- AP Client: This mode is used to connect with an AP.

● **Channel/Frequency**

Select the channel that you plan to use.

● **Wireless Mode**

- 802.11g Only: Setup 802.11g network and only 802.11g STA could connect up it.
- 802.11b Only: Setup 802.11b network and only 802.11g/b STA could connect up it.
- Auto(11g and 11b):Setup 802.11g/b network and only 802.11g/b STA could connect up it.

- **Beacon Interval**

Specifies the interval time (20 ~1000ms) for each beacon transmission.

- **DTIM Interval**

The Delivery Traffic Indication Message, Specifies the data beacon rate between 1 and 255.

- **WMM Support**

Enable this option can ensure the throughput of the voice and video data stream.

- **Number of Wireless Stations Allowed to Associate**

This feature could control STA connection. While the number is more than the max value, it will stop STA connecting.

- **Radio Enable**

When disable radio, device will stop sending beacon.

- **Output Power Management**

Adjust the transmit power of the Access Point. The more the Output Power the more area of the wireless signal can reach

- **Data Rate Management**

To set device's send data rate, the default value is Best. The available transmit data rate of the wireless network. You also can choose lower data rate in order to transmit data in longer distance.

- **Preamble Type**

A long preamble ensures compatibility between the access point and all early Wireless LAN Adapters. And Auto include Short and Long preamble.

- **Super-G Mode**

Super-G mode provides higher speed transmissions than regular IEEE 802.11g. The other device must also support Super mode in order for the device to use it for the wireless connection. This is available when you select a Wireless Mode that includes IEEE 802.11g.

- **Turbo-G Mode**

Turbo-G mode provides higher speed transmissions than Super-G mode.

- **RTS/CTS Threshold**

Request to Send Threshold. Its value is from 0 to 2346 bytes, RTS is designed to solve Network collision. It will make signals lose if two stations send data to AP at the same time. When the transmitted data size is larger than RTS threshold, the RTS mechanism will be active. The transmitting station sends out an RTS packet to the receiving station, and waits for the receiving station to send back a CTS (Clear to Send) packet before sending the actual packet data. The other station which have listen the CTS will waits for a time before send data. The default value is 2346 and not active. If set it to zero, this function will be active always.

- **Fragmentation**

This is the maximum packet size used for fragmentation and can only be set as even number. Packets larger than the size programmed in this field will be fragmented. The little packet data can reduce loses and raises the quality of transmission.

 **Notice:**

**The Fragment Threshold value should be larger than the RTS Threshold value or the RTS Threshold is zero, otherwise the RTS function will not work.**

- **Load Balance**

There are two modes: User and Flux. In order to enhance performance, some devices could be united in one group with the same group name via a hub or switch. Several AP use the same ESSID and Encryption. When many users access the Internet, these devices can give a balance state.

# Chapter 5 Advanced Configuration

## VAP(Virtual AP) Setup

One device could be used to eight devices. So you could easy setup your network and manage different users. And the eight VAP could set different security to protect your network.

<b>Security Profile Settings</b>					
<b>Security Profiles</b>					
	#	Profile Name	SSID	Security	Enable
<input type="radio"/>	1	Profile1	WirelessAP	Disable	<input checked="" type="checkbox"/>
<input type="radio"/>	2	Profile2	Wireless	Disable	<input type="checkbox"/>
<input type="radio"/>	3	Profile3	Wireless	Disable	<input type="checkbox"/>
<input type="radio"/>	4	Profile4	Wireless	Disable	<input type="checkbox"/>
<input type="radio"/>	5	Profile5	Wireless	Disable	<input type="checkbox"/>
<input type="radio"/>	6	Profile6	Wireless	Disable	<input type="checkbox"/>
<input type="radio"/>	7	Profile7	Wireless	Disable	<input type="checkbox"/>
<input type="radio"/>	8	Profile8	Wireless	Disable	<input type="checkbox"/>
<input type="radio"/>		<b>sta_profile</b>	Wirelessssdgsg	Disable	<input checked="" type="checkbox"/>
<input type="radio"/>		<b>wds_profile</b>		Disable	<input checked="" type="checkbox"/>

**Figure 6 VAP Settings**

You could select one profile to edit as follow:

## Security Profile 1 Configuration

<b>Profile Definition</b>	
Security Profile Name	Profile1
SSID	WirelessAP
Broadcast SSID	<input checked="" type="radio"/> Yes <input type="radio"/> No
Intra-BSS Traffic	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
<b>Security Settings</b>	
Encryption Method	802.1X
Data Encryption	None
<b>Authentication Server</b>	
Authentication Server IP Address	0 . 0 . 0 . 0
Port Number	1812
Shared Secret	(0-64 alphanumeric, hexadecimal 0-9 A-F and no spaces)
<b>Rekey Options</b>	
Reauthentication Time	3600 Seconds (max. 100 - 3600)
<input type="checkbox"/> Global-Key Update	
<input checked="" type="radio"/> every	3600 Seconds (max. 100 - 3600)
<input type="radio"/> every	1000 X1000 Packets (max. 100 - 3600)

Figure 7 Security Set

- **Security Profile Name**

You could use a friendly name to manage different VAP.

- **SSID**

The SSID is a unique ID used by Access Points and Stations to identify a wireless LAN.

Wireless clients associating to any Access Point must have the same SSID. The default ESSID is “Wireless”. The ESSID can up to 32 characters

- **Broadcast SSID**

If you hide the SSID, then the device cannot be seen when a wireless client scans for local APs. The trade-off for the extra security of “hiding” the device may be inconvenience for some valid WLAN clients.

- **Wireless Client Security Separation**

Wireless Client Security Separation could stop the connected STA communicating with each other.

- **Encryption Method**

Choose the following type.

➤ WEP

1. Open System: wireless device does not any authentication and can be connected with Access point. But the message between wireless device and Access point also use encryption through the following type “authentication type”.
2. Shared Key: If Shared Key is selected, you need to enabled WEP and enter at least one shared key. “Shared Key” authentication type is working cooperate with “data encryption type”. The specify key of WEP encryption configure not only be encrypted the message between wireless device and Access point ,but also it will be use validated the wireless Access point ,when wireless device attempt to connected with Access point .

- 802.1x: IEEE 802.1x is a standard for network access control (port based), which was introduced especially for distributing encryption keys in a wireless network. The Access Point supports 802.1x for keeping out unauthorized users and for verifying the credentials of users with RADIUS so that authorized users can access the network and services. To use 802.1x, you will need at least one common Extensible Authentication Protocol (EAP) method on your authentication server, Access Points (authenticator) and stations (supplicant). 802.1x is also used to perform generation and distribution of encryption keys with enabling Data Encryption as WEP from AP to the station as part of or after the authentication process.
- WPA, WPA2 WPA & WPA2: In cooperation with RADIUS, systems with WPA-EAP will be used with a new encryption method called Temporal Key Integrity Protocol (TKIP) implementation with 802.1x dynamic key exchange.
- WPA-PSK, WPA2-PSK, WPA-PSK & WPA2-PSK: Instead of using RADIUS for authentication, systems with WPA-PSK will be configured with a secret password phrase. Enter your password phrase and press “Generate”. You can now create a pre-shared key in the Access Point and copy the characters you input to the station's WPA-PSK entry. A shared secret is only secure as long as no third party knows about it.

 **Notice:**

**You must configure RADIUS Server Settings with either Legacy 802.1x, WPA or WPA2 option.**

- **Authentication Server**

This configuration is required for authentication using RADIUS. IP Address, Port No. and Shared Secret is required for communication with RADIUS Server.

- IP Address: IP address of the RADIUS Server. The default is 0.0.0.0
- Port Number: Port number of the RADIUS Server. The default is 1812.
- Shared Secret: This is shared between the Wireless Access Point and the RADIUS Server while authenticating the supplicant.

## **Bridge Mode Setup**

In Wireless Settings page, you could set operation mode to bridge. And you should input remote MAC address to setup WDS link.

## Wireless Settings

The setting has been applied

### Basic Settings

Operation Mode	<input style="border: 1px solid black; padding: 2px 10px; margin-bottom: 2px;" type="button" value="Bridge"/>
Channel	<input style="border: 1px solid black; padding: 2px 10px; margin-bottom: 2px;" type="button" value="6"/>
Wireless Mode	<input style="border: 1px solid black; padding: 2px 10px;" type="button" value="Auto (11g/11b)"/>

---

**Figure 11 Security Set in AP Client Mode**

## 802.1Q VLAN Setup

In AP mode, you could enable 802.1Q VLAN to manage users.

<b>VLAN (802.1Q)</b>	
<input type="checkbox"/> <b>Enable 802.1Q VLAN</b>	
Management VLAN ID:	<input type="text"/>
Profile1 VLAN ID:	<input type="text"/>
Profile2 VLAN ID:	<input type="text"/>
Profile3 VLAN ID:	<input type="text"/>
Profile4 VLAN ID:	<input type="text"/>
Profile5 VLAN ID:	<input type="text"/>
Profile6 VLAN ID:	<input type="text"/>
Profile7 VLAN ID:	<input type="text"/>
Profile8 VLAN ID:	<input type="text"/>

**Figure 12 802.1Q VLAN**

- **Management VLAN ID**

Management VLAN ID is used to manage device and monitor the network.

- **Profile VLAN ID**

Profile VLAN ID is used to manage VLAN. You could set ID 1~4049.

## MAC Filter

The optional MAC Filter window lets you block the network access privilege of the specified stations through the Access Point. This provides an additional layer of security. There are two kinds of MAC Filter.

## MAC Address Filter

Active

Allow the following MAC Address to associate

Deny the following MAC Address to associate

#	MAC Address	#	MAC Address
1	00:00:00:00:00:00	2	00:00:00:00:00:00
3	00:00:00:00:00:00	4	00:00:00:00:00:00
5	00:00:00:00:00:00	6	00:00:00:00:00:00
7	00:00:00:00:00:00	8	00:00:00:00:00:00
9	00:00:00:00:00:00	10	00:00:00:00:00:00
11	00:00:00:00:00:00	12	00:00:00:00:00:00
13	00:00:00:00:00:00	14	00:00:00:00:00:00
15	00:00:00:00:00:00	16	00:00:00:00:00:00

**Figure 13 MAC Filter**

You could enable MAC Filter and input the allowed or denied STA's MAC.

## Throughput Accelerate

There are two ways to accelerate throughput in our Access Points: Super-G and Turbo-G.

- **Super-G Application**

If open Super-G Function, it can obviously improve the throughput of wireless network. The following table gives you a reference.

**Diagram 3 Super-G Reference Throughput**

Mode	Super-G OFF	Super-G ON
AP mode	20Mbps	26Mbps
Bridge mode	20Mbps	27Mbps
AP Client mode	20Mbps	26Mbps

 **Notice:**

**AP and client support Super-G.**

- **Turbo-G**

The following table gives you a reference.

**Diagram 4 Turbo-G Reference Throughput**

Mode	Turbo-G OFF	Turbo-G ON
AP mode	20Mbps	30Mbps

AP and client support Turbo-G.

# Chapter 6 Management

## View Device's Status

Status						
<b>Device Information</b>						
Device Name:	APc94dcb					
Operation Mode:	AP					
Firmware Version:	1.0.16					
<b>IP Settings</b>						
IP Address:	192.168.0.228					
Subnet Mask:	255.255.255.0					
Gateway IP Address:	0.0.0.0					
<b>Wireless Settings</b>						
Channel:	6					
MAC Filter:	Disable					
<b>Security Profiles</b>						
#	Profile Name	SSID	MAC	Security	VLAN	Status
1	Profile1	WirelessAP	00:60:b3:c9:4d:cb	Disable		Enable
2	Profile2	Wireless	06:60:b3:c9:4d:cb	Disable		Disable
3	Profile3	Wireless	0a:60:b3:c9:4d:cb	Disable		Disable
4	Profile4	Wireless	0e:60:b3:c9:4d:cb	Disable		Disable
5	Profile5	Wireless	12:60:b3:c9:4d:cb	Disable		Disable

Figure 14 Status

The Status page displays current settings and statistics of your Access Point that is Read-only, and any change of settings must be made on other pages.

## View Association List

Association list				
#	MAC Address	IP Address	Signal Strength	Status
1	00:16:6f:06:b7:ae	169.254.119.229	68%	Associated
Rescan				

Figure 15 Association List

In Status page, click **View Association List** to show the wireless stations that are currently associated to the device.

## View Statistics

**View Statistics**

Ethernet		
	Received	Transmitted
Packets	22540	32098
Bytes	1859497	41594611

Wireless		
	Received	Transmitted
Unicast Packets	0	42
Broadcast Packets	0	0
Multicast Packets	0	0
Total Packets	0	42
Total Bytes	0	3408

System Up Time 03:08:42

Poll Interval :  (0-65534)

**Figure 16 Statistics Info**

In Status page, click **View Statistics** to see performance statistics such as number of packets sent and number of packets received.

## Change Password

### Password Setup

---

Current Password	<input type="text"/>
New Password	<input type="text"/> (max 19 characters)
Retype to Confirm	<input type="text"/>

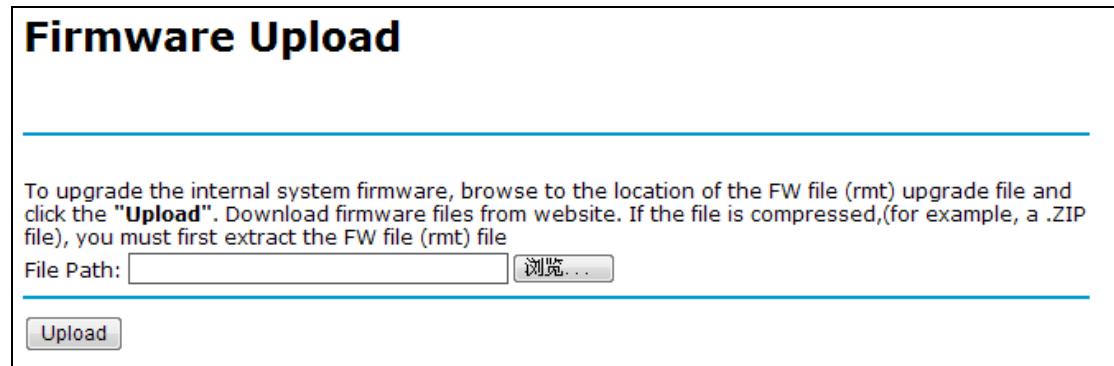

---

**Figure 17 Change Password**

In Password Setup page, you could change the password for accessing the Settings pages.

## Firmware Upload

In F/W Upload page, you could upgrade Access Point software.

**Firmware Upload**

To upgrade the internal system firmware, browse to the location of the FW file (rmt) upgrade file and click the "Upload". Download firmware files from website. If the file is compressed,(for example, a .ZIP file), you must first extract the FW file (rmt) file

File Path:

**Figure 18 Firmware Upload**

1. Open Upgrade Firmware page
2. Click browser button and select the firmware file in local hard disk.
3. Click Upload button.
4. After upgrade, login again and check the software version.

Do not try to turn off the Access Point, shutdown the computer or do anything else to the Access Point until the Access Point finishes restarting!

## Configuration File

There are two kinds way to backup or restore Access Point.

## Configuration File

### Backup Configuration

This page allows you to backup your current configuration to your computer. Click the "**Backup**" button to start the backup process.

### Restore Configuration

To restore your configuration from a previously saved configuration file, browse to the location of the configuration file and click the "**Upload**" button

File Path:

### Back to Factory Defaults

The "**Reset**" button will clear all user-entered configuration and will reset the device settings back to its factory default value. After reset to factory default settings, please remember the following value to be able to login the device again.

- Password: password
- LAN IP Address: 192.168.0.228

**Figure 19 Configuration File**

Click button to save backup file to hard disk.

Click Browser button to locate the backup file you want to retrieve and click retrieve button, then the AP will restart.

 **Notice:**

**Do not try to turn off the Access Point, shutdown the computer or do anything else to the Access Point until the Access Point finishes restarting!**

## Restore to Factory

There are two kinds way to restore Access Point to factory.

- **Software Default**

Open Configuration File page, click Reset button then the AP will restart to factory.

- **Hardware Default Button**

Press the Reset button about five seconds when AP works.

## Management Control

Management Control function lets you allow or deny the specified IP address to manage the device.

### Management Control

---

Turn Management Control On

Allow

Deny

#	IP Address	#	IP Address
1	0.0.0.0	2	0.0.0.0
3	0.0.0.0	4	0.0.0.0
5	0.0.0.0	6	0.0.0.0
7	0.0.0.0	8	0.0.0.0
9	0.0.0.0	10	0.0.0.0
11	0.0.0.0	12	0.0.0.0
13	0.0.0.0	14	0.0.0.0
15	0.0.0.0	16	0.0.0.0
17	0.0.0.0	18	0.0.0.0

Figure 20 Management Control

## Reboot AP

### Reboot

---

Reboot AP:  Yes  No

---

Figure 21 Reboot AP

You may select Yes on Reboot page and then click on Apply button to reboot the access point.

## Remote Management

**Remote Management**

**SNMP**

SNMP  Enable  Disable

Public Community Name: public

Private Community Name: private

IP Address to Receive Traps: 0.0.0.0

**Apply** **Reset**

**Figure 22 Remote Management**

SNMP Settings.

- IP Address to Receive Traps: You can find the unusual log on the Trap Server.
- Public Community Name: Set the Read Community;
- Private Community Name: Set the write Community;

## View Log

You could check system log to view the operations between AP and STA.

**Log List**

**Refresh** **Clear Log**

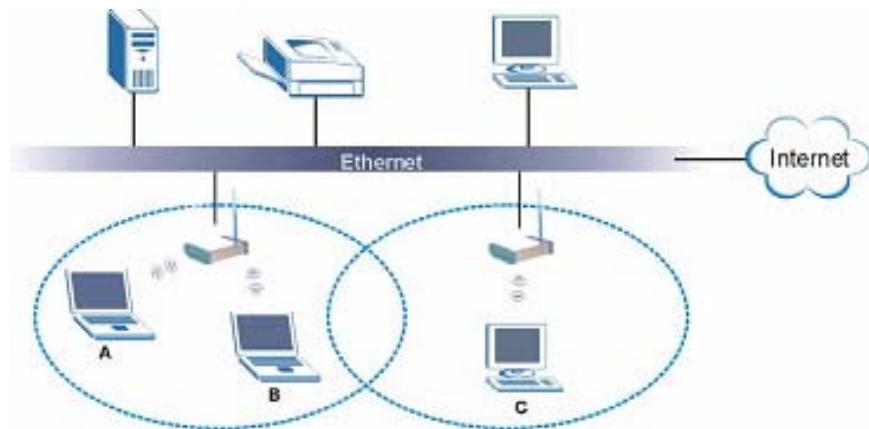

#	Time	Source	Message
1	3095	00:60:B3:C9:4D:CB	WLAN service started.
2	3097	00:60:B3:C9:4D:CB	WLAN service stopped.
3	3097	00:60:B3:C9:4D:CE	Remote Bridge AP configured.
4	3097	00:60:B3:C9:4D:CB	WLAN service started.
5	3100	00:60:B3:C9:4D:CB	WLAN service stopped.
6	3100	00:60:B3:C9:4D:CE	Remote Bridge AP configured.
7	3100	00:60:B3:C9:4D:CB	WLAN service started.
8	3323	00:60:B3:C9:4D:CB	WLAN service stopped.
9	3323	00:60:B3:C9:4D:CB	WLAN service started.
10	3326	00:60:B3:C9:4D:CB	WLAN service stopped.
11	3326	00:60:B3:C9:4D:CB	WLAN service started.
12	3327	00:60:B3:00:FD:39	Station authenticated.
13	3327	00:60:B3:00:FD:39	Station associated.

**Figure 23 Log**

# Chapter 7 Typical Applications

## Wireless Coverage

In the AP mode, it can be set as wireless coverage spot.

**Figure 24 Wireless Coverage Application**

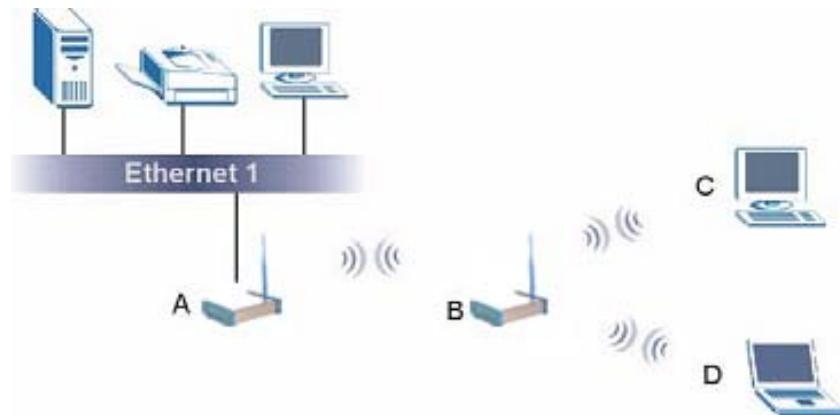

STA-A/B/C connect AP by SSID, and then they can access PC in Ethernet and internet.

Do steps as following:

1. Set Operation Mode as AP mode in Wireless Settings page. If you want to be compatibility with 802.11b device, you should set Wireless Mode as Auto.
2. Open Security Profile page, you could enable profile 1~8 and 802.1Q VLAN
3. Select a profile to edit, and set basic parameters as SSID, Security, etc. If you want to use 802.1x, you should set Radius.
4. STA use the same authentication to connect with AP, and then STA could access Internet, mobile office freely.

## Wireless Bridge

The wireless bridge between two places is one application condition, here we will introduce you how to build such network quickly.

**Figure 25 Point to Multi-Point Application**

Access Points builds connection by WDS (Wireless Distribution System) mode. The main setting is remote MAC address. The following steps are the way.

1. After power on two Access Points, use two computers to connect each of them by network cable.
2. Set Operation Mode as Bridge mode in Wireless Settings page, add MAC address of remote wireless bridge and set the real Wireless Space.
3. Now the two Access Points have normally worked. You can change settings account to your need. The detail about changing settings is in above chapter.
4. You could check the link in View Association List page.

# Chapter 8 Troubleshooting

## How to know the MAC address of the Access Point?

- The MAC address is written in a label which is in the bottom of Access Point.
- From the General page of WEB configuration, you also can get the MAC address of AP.

## Why STA can't connect with AP?

The process of STA connects with AP need probe request, auth, connect steps, so you could do:

- STA can't detect AP. So you could check the domain or country, to keep AP and STA use the same one.
- STA and AP use different authentication and keys.
- To check the other AP exists or not. If it exists, you may try to turn it off or move other place.
- To check other devices exists or not, such as microwave oven. If it exists, you may try to turn it off or move other place.
- STA can't be compatibility with AP. STA may not pass Wi-Fi authentication.

## Why the throughput is not high?

You should adjust antenna to get highest signal strengthens. If can not get higher signal strengthens, please check the following steps:

- Wireless Channel/Frequency. Try to change other channel.
- Wireless disturbance. Check whether there are other wireless equipments nearby AP; make sure they do not disturb AP.
- To check if the antenna becomes flexible.
- To check signal strength. If the signal strength is very low, you may check the antenna or the device aging.
- To check the STA, and its output power may be low.

## Why two Access Points can not build connection after setting?

- Check the “Operating Mode” whether is “Bridge Mode”.
- Check the “remote MAC address” whether is right.
- Check the “Country/Region” whether is same.
- Check the “Channel/Frequency” whether is same.
- Check the “Data Encryption” and “Key” whether is same.

### **The wireless becomes unstable such as ping timed out and lose packet after a period of well work?**

This situation may the wireless network is disturbed by something, what you can do is following steps:

- check whether every joint point of network is well (such as Ethernet port, antenna connection)
- Change the channel if the Link Test value is not high, excluding other wireless equipments disturb AP.
- Restart AP.
- Default AP and restore last settings.
- Check the wireless port and Ethernet port environment and virus exist or not.

Please call the sales if can not solve problem after all.

### **Why can not open WEB page of remote wireless bridge in local network?**

Because this kind of settings will slow the response of remote AP WEB Server, just waiting for several minutes or restarting remote wireless bridge is a way to solve problem. We suggest you set AP in local wired Ethernet network.

# Appendix A. Specifications

## Diagram 5 Device Specification

**ZG-7600H-P IEEE 802.11g 54Mbps Wireless Access Point**

**Designing to IEEE 802.11g WLAN network that works at 2.4 GHz Direct Sequence Spread Spectrum (DSSS), ZDC ZG-7600H-P, a 4-in-1 WLAN Access Point, can be operated in one of the following 4 modes, except general access point, also include AP client, repeater and point to point bridge. With data rate of up to 108Mbps, ZG-7600H-P is capable of delivering large files and streams MPEG video. It is ideal WLAN application in home or small office environment. With latest WPA2 and 802.11i standard, ZG-7600H-P has much higher level of security to connect to your network. With ZG-7600H-P, users can have productive and freedom of wireless mobility in home, office and public environment**

- 200mW Output Power
- Accord with ROHS
- Three color options: Red, Black, Blue
- Support power over Ethernet (802.3af)
- Multi-operating mode options : AP/Bridge/WDS/AP Client
- Provide the highest available level of WEP / WPA / WPA2 / 802.1X and Limitation of client connections to enhance security.
- Support the function of QoS (WMM) / Multi-BSSID / VLAN / Load Balance of Multi AP
- Support Super G / Turbo G

<b>System</b>

## Appendix B. ASCII Character Chart

You can dispose hexadecimal number system counting or ACSII one yard of keys encrypted as WEP. Hexadecimal number system is made up by 0-9 and A-F (letter does not distinguish capital and small letter); ACSII yard is by 0-9 figures, A-F, a-f (letter distinguishes capital and small letter), and the punctuation mark makes up. Each ACSII yard can is it says to count by one hexadecimal number system of two. One-one ACSII yard of all and hexadecimal number system are counted to make forms and list all.
