

Operation Description

Please refer to the schematic diagram named TX083X9SCH. The battery supplies power to the circuit, The red LED will blinking per 6s, or when the user press the switch button. The red LED will blinking. The U1(HT48R05A-1) encodes address and data codes into a coded waveform suitable for TX modulation 。 Transistor Q1 and surface-acoustic-wave resonator W1 and other electronics components perform TX oscillating and amplifying.
