

R251W Operation description

R251W, using “LIGHT” key and touch screen keys, learns code with master T955WH. After learning code successfully, CPU chip transmit data to IC24C08 which will memorize the communication code. Then CPU enters into sleeping mode, U4 IC will probe temperature and humidity and transmit data to U2 CPU chip. CPU will process those data after received it, then transmit data to master T955WH.
