## CERTIFICATION OF COMPLIANCE

FCC ID.

**V6OLMT100**

APPLICANT

**QUFIELD CO.,LTD.**

<b>Device Category</b>	:	Licensed Non-Broadcast Station Transmitter
<b>Manufacturing Description</b>	:	MULTIPURPOSE CORDLESS CALLING SYSTEM
<b>Manufacturer</b>	:	QUFIELD CO.,LTD.
<b>Trade mark</b>	:	QUFIELD
<b>Model name</b>	:	LM-T100
<b>Serial number</b>	:	Identical prototype
<b>FCC Rule Part(s)</b>	:	§2, §90
<b>Frequency Range</b>	:	447.8625MHz
<b>RF Output Power</b>	:	11.18dBm
<b>Channel Separation</b>	:	Only one channel
<b>Emission Designators:</b>	:	11K2F1D
<b>Data of issue</b>	:	Aug 18, 2009

This test report is issued under the authority of:

The test was supervised by:

Dong-Min JUNG, Technical Manager

Kyung-Taek LEE, Test Engineer

This test result only responds to the tested sample. It is not allowed to copy this report even partly without the allowance of the test laboratory. This report must not be used by the applicant to claim product endorsement by any agency.

NVLAP LAB Code.: 200723-0

APPENDIX I TEST EQUIPMENT USED FOR TESTS -----	17
APPENDIX II TEST PLOTS -----	19

## 1. General information's

### **1-1 Test Performed**

Company name : LTA Co., Ltd.  
 Address : 243, Jubug-ri, Yangji-Myeon, Youngin-Si, Kyunggi-Do, Korea. 449-822  
 Web site : <http://www.ltalab.com>  
 E-mail : [chahn@ltalab.com](mailto:chahn@ltalab.com)  
 Telephone : +82-31-323-6008  
 Facsimile : +82-31-323-6010

Quality control in the testing laboratory is implemented as per ISO/IEC 17025 which is the “General requirements for the competents of calibration and testing laboratory”.

### **1-2 Accredited agencies**

LTA Co., Ltd. is approved to perform EMC testing by the following agencies:

Agency	Country	Accreditation No.	Validity	Reference
NVLAP	U.S.A	200723-0	2009-09-30	ECT accredited Lab.
RRL	KOREA	KR0049	2011-06-20	EMC accredited Lab.
FCC	U.S.A	610755	2011-04-22	FCC filing
VCCI	JAPAN	R2133, C2307	2011-06-21	VCCI registration
IC	CANADA	IC5799	2010-05-03	IC filing

## 2. Information's about test item

### 2-1 Client & Manufacturer

Company name : QUFIELD CO.,LTD.  
 Address : 1485-13,BF1, SONGRYONG BLDG SEOCHO-DONG,  
 SEOCHO-GU, SEOUL, KOREA.  
 TEL / FAX : 82-31-420-4782

### 2-2 Equipment Under Test (EUT)

Trade name : MULTIPURPOSE CORDLESS CALLING SYSTEM  
 FCC ID : V6OLMT100  
 Model name : LM-T100  
 Serial number : Identical prototype  
 Date of receipt : August 3, 2009  
 EUT condition : Pre-production, not damaged  
 Antenna type : Helical Antenna  
 Frequency Range : 447.8625 MHz  
 RF output power : 11.18dBm  
 Channel Separation : -  
 Power Source : Input: 120VAC, Output: 12VDC, 0.78A used adaptor

### 2-3 Tested frequency

	LOW	MID	HIGH
Frequency (MHz)	-	447.8625	-

### 2-4 Ancillary Equipment

### 3. Test Report

#### 3.1 Summary of tests

FCC Part Section(s)	Parameter	Status (note 1)
2.1046 90.205	Carrier Output Power (Conducted)	C
2.1051 90.210	Unwanted Emissions (Transmitter Conducted)	C
2.1053 90.210	Field Strength of Spurious Radiation	C
2.1049 90.209	Emission Masks (Occupied Bandwidth)	C
90.214	Transient Frequency Behavior	C
2.1055 90.213	Frequency Stability	C
2.201	Emssion Designator	Noted
2.1033 (c)	DC Voltages and Current into Final Amplifier	Noted
15.207 /15.107	AC Conducted Emssion (ANSI C-63.4-2003)	C

*Note 1:* C=Complies NC=Not Complies NT=Not Tested NA=Not Applicable

The following measurement report is submitted on behalf of applicant in support that the certification in accordance with Part 2 Subpart J and Part 90 of the Commission's Rules and Regulations.

## 3.2 Transmitter requirements

### 3.2.1 Carrier Output Power (Conducted)

#### Definition:

- The carrier power output for a transmitter for this service is the power available at the output terminals of the transmitter when the output terminals are connected to the standard transmitter load.

Specification : 47 CFR 2.1046 (a)  
 Test method : ANSI/TIA/EIA-603-C-2004

#### Measurement Procedure:

- (1) Antenna was replaced with a short connector
- (2) The spectrum offset was adjusted to compensate the losses caused by the connection.
- (3) Set the spectrum., RBW = 100KHz, VBW = 100KHz, SPAN = 100KHz

Frequency(MHz)	Rated(dBm)	Output power(dBm)	Power(mW)
447.8625	10	11.18	13.12
<b>Measurement uncertainty</b>		<b>± 0,45dB</b>	

#### Measurement Data:

- Refer to the Appendix II.

### 3.2.2 Unwanted Emissions (Transmitter Conducted)

#### Definition:

- Conducted spurious emissions are emissions at the antenna terminals on a frequency or frequencies which are outside a band sufficient to ensure transmission of information of required quality for the class of communication desired.

Specification : 47 CFR 2.1051  
 Test method : ANSI/TIA/EIA-603-C-2004

#### Measurement Procedure:

- (1) Set the ref level to the RF power output.
- (2) Antenna was replaced with a short connector
- (3) The spectrum offset was adjusted to compensate the losses caused by the connection.
- (4) Set spectrum Frequency start from 30MHz to 5GHz, RBW = 100KHz, VBW = 100KHz.

To record the spurious emissions.

Frequency(MHz)	Spurious(dBm)	Limit(dBm)	Result
30MHz-5GHz	Underlimit	-20	Pass

#### LIMIT

-20dBm

#### Measurement Data:

- Refer to the Appendix II.

### 3.2.3 Field Strength of Spurious Radiation

**Definition:**

- Radiated spurious emissions are emissions from the equipment when transmitting into a non-radiating load on a frequency or frequencies which are outside an occupied band sufficient to ensure transmission of information of required quality for the class of communications desire.

Specification : 47 CFR 2.1053(a)  
Test method : ANSI/TIA/EIA-603 2.2.12

**Measurement Procedure:**

- (1) Set-up followed by TIA/EIA-603 2.2.12 (Substitution Method)
- (2)  $P_d \text{ (dBm)} = P_g \text{ (dBm)} - \text{Cable loss (dB)} + \text{antenna gain (dB)}$   
(where,  $P_d$  is the equivalent power and  $P_g$  is the generator output into the substitution antenna)

**LIMIT**

---

All spurious emission are to be attenuated by at least  $50 + 10 \log_{10} (P) \text{ dBc}$   
The rated power of 10mW gives a limit of -20dBm

---

**Measurement Data: Attached for Worst Case**

Freq. (MHz)	Pol. (H/V)	Signal Generator level(dBm)	C.F	Emission Level (dBm)	Limit (dBm)
298.63	V	-36.34	6.3	-30.01	-20
397.49	V	-32.13	6.6	-25.53	-20
496.30	V	-41.10	5.5	-35.60	-20
595.23	V	-40.82	9.2	-31.62	-20
2688.4	V	-42.44	10.1	-32.34	-20

Remarks

C.F = Antenna gain - Cableloss

No emissions were detected at a level greater than 20dB below limit.

### 3.2.4 Emission Masks (Occupied Bandwidth)

**Definition:**

- The term transmitter Sideband Spectrum denotes the sideband energy produced at a discrete frequency separation from the carrier up to the test bandwidth due to all sources of unwanted noise within the transmitter in a modulated condition.

Specification : 47 CFR 2.1049(c)(1)  
Test method : ANSI/TIA/EIA-603-C-2004

**Measurement Procedure:**

- (1) Set the ref level to the RF power output.
- (2) Antenna was replaced with a short connector
- (3) The spectrum offset was adjusted to compensate the losses caused by the connection.  
Set spectrum, RBW = 100Hz, VBW = 100Hz, SPAN = 50KHz
- (4) Set the EUT at modulation mode.
- (5) The Occupied Bandwidth was measured with the Spectrum Analyzer controls set as shown on the test results.

**Measurement Data:**

- Refer to the Appendix II.

### 3.2.5 Transient Frequency Behavior

#### Definition:

- The transient frequency behavior is a measure of the difference, as a function in time, of the actual transmitter frequency to the assigned transmitter frequency when the transmitted RF output power is switched on or off.

Specification : 47 CFR 90.214  
 Test method : ANSI/TIA/EIA-603-C-2004

#### Measurement Procedure:

- The EUT was set up as shown on the attached page, following TIA/EIA-603 steps a, b, and c as a guide.
- The transmitter was turned on.
- Sufficient attenuation was provided so that the transmitter carrier level measured at the output of the combiner was 40 dB below the maximum input level of the test receiver. This level was recorded as step f.
- The transmitter was turned off.
- An RF signal generator (1) modulated with a 1 kHz tone at either 25, 12.5, or 6.25 kHz deviation, and set to the same frequency as the assigned transmitter frequency, (2) was adjusted to a level -20 dB below the level recorded for step f, as measured at the output of the combiner. This level was then fixed for the remainder of the test and is recorded at step h.
- The oscilloscope was set up using TIA/EIA-603 steps j and k as a guide, and to either 10 ms/div (UHF) or 5ms/div (VHF).
- The 30 dB attenuator was removed, the transmitter was turned on, and the level of the carrier at the output of the combiner was recorded as step l.
- The carrier on-time as referenced in TIA/EIA-603 steps m, n, and o was captured and plotted. The carrier off-time as referenced in TIA/EIA-603 steps p, q, r, and s was captured and plotted.
- For EUTs supporting audio modulation, the audio signal generator was adjusted to the frequency of maximum response and with output level set for  $\pm 2.5$  /  $\pm 1.25$  kHz deviation (or 50% modulation). With level constant, the signal level was increased 16dB.
- For EUTs supporting digital modulation, the digital modulation mode was operated to its maximum extent.
- The Occupied Bandwidth was measured with the Spectrum Analyzer controls set as shown on the test results.

#### Measurement Data:

- Refer to the Appendix II.

### 3.2.6 Frequency Stability

#### Definition:

- Modulation limiting refers to the transmitter circuits ability to limit the transmitter from producing deviations due to modulation in excess of a rated system deviation.

Specification	: 47 CFR 2.1055
Test method	: ANSI/TIA/EIA-603-C-2004

#### Measurement Procedure:

The frequency stability of the transmitter is measured by:

- a) Temperature: The temperature is varied from -30 to +60 using an environmental chamber.
- b) Primary Supply Voltage: The primary supply voltage is varied from 85% to 115% of the voltage normally at the input to the device or at the power supply terminals if cables are not normally supplied.

Specification- The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block. The frequency stability of the transmitter shall be maintained within  $\pm 0.00025$  ( $\pm 2.5\text{ppm}$ ) of the center frequency.

#### Time Period and Procedure:

1. The carrier frequency of the transmitter and the individual oscillators is measured at room temperature (25 to 27 to provide a reference).
2. The equipment is subjected to an overnight “soak” at -30 without power applied.
3. After the overnight “soak” at 30 (usually 14-16 hours), the equipment is turned on in a “standby” condition for one minute before applying power to the transmitter. Measurement of the carrier frequency of the transmitter and the individual oscillators is made within a three minute interval after applying power to the transmitter.
4. Frequency measurements are made at 10 interval up to room temperature. At least a period of one and one half-hour is provided to allow stabilization of the equipment at each temperature level.
5. Again the transmitter carrier frequency and the individual oscillators is measured at room temperature to begin measurement of the upper temperature levels.
6. Frequency measurements are at 10 intervals starting at -30 up to +60 allowing at least two hours at each temperature for stabilization. In all measurements the frequency is measured within three minutes after re-applying power to the transmitter.
7. The artificial load is mounted external to the temperature chamber.

NOTE: The EUT is tested down to the battery endpoint.

#### Measurement Data:

- Refer to the Appendix II.

### 3.2.7 Emissions Designator (Part 2.201)

Referencing Part 2.201 and 2.202 of the FCC Rules and Regulation and using the following formula the Emissions Designator(s) and Necessary Bandwidths were calculated.

Necessary Bandwidth:

$$B = 2M + 2DK$$

Frequency deviation (D) = 5.1 KHz

Baud rate = 960 baud

$$M = \text{Baud} / 2 = 1200 / 2 = 480$$

D = 5.1 KHz and using K = 1

For the 5.1 KHz deviation:

$$B = 2(480) + (2)(5100)(1) = 11160$$

Emission Designator: The EUT is an FM device containing digital information for data transmission therefore the emission designator is F1D.

Final emission designator: 11K2F1D

### 3.2.8 POWER INPUT (Part 2.1033 (c))

DC Voltages and Current into Final Amplifier:

POWER INPUT

FINAL AMPLIFIER ONLY

Vce = 12 Volts

IC = 45 mA

### 3.2.9 AC Conducted Emissions

#### Procedure:

The conducted emissions are measured in the shielded room with a spectrum analyzer in peak hold. While the measurement, EUT had its hopping function disabled at the middle channels in line with Section 15.31(m). Emissions closest to the limit are measured in the quasi-peak mode (QP) with the tuned receiver using a bandwidth of 9 kHz. The emissions are maximized further by cable manipulation and Exerciser operation. The highest emissions relative to the limit are listed.

#### Measurement Data: Complies

- See next pages for actual measured spectrum plots.
- No emissions were detected at a level greater than 10dB below limit.
- The used antenna is “R-AN2400-1901RS” and it gave the worse case emissions.

#### Minimum Standard: FCC Part 15.207(a)/EN 55022

Frequency Range (MHz)	Conducted Limit (dBuV)	
	Quasi-Peak	Average
0.15 ~ 0.5	66 to 56 *	56 to 46 *
0.5 ~ 5	56	46
5 ~ 30	60	50

\* Decreases with the logarithm of the frequency
