

How it all works:

The operation of the Wavlt is conceptually very simple.

- 1. The POD emits (invisible) IR beams:* These serve as beacons for the controller to lock onto.
- 2. The Wavlt Controller tracks:* The “smarts” are in the Controller. An on-board camera and image system filters the image, analyses it in real time and sends its own coordinates via 2.4GHz radio to the POD.
- 3. The POD communicates with the PC:* It passes information between the POD and the PC.
