Center for Quality Engineering

Test Report No.: D0XD0001

FCC ID: VBNFRIE-01

Order No.: D0XD **Pages:** 71 **Munich,** Oct 20, 2010

Client:	Nokia Siemens Networks Oy
Equipment Under Test:	Flexi Multiradio BTS RF module 1.7/2.1GHz Flexi WCDMA BTS RF module 1.7/2.1GHz Radio Access Technology: UTRA
Manufacturer:	Nokia Siemens Networks Oy
Task:	Conformance test according to the test specifications mentioned below
Test Specification(s):	FCC 47 CFR Part 2 and 27
Result:	The EUT complies with the requirements of the specification.

The results relate only to the items tested as described in this test report.

CONTENTS

1 Summary

The measurements described in this report were conducted pursuant to 47 CFR § 2.947. All applicable paragraphs of the 47 CFR parts 2 and 27 of the most current version of the rules were considered.

The following tests were performed according to the FCC rules in order to verify the compliance of the EUT with the FCC requirements:

Test No.	Measurement	FCC Rule	Page Number of this Report	Result
1	RF Power Output	§ 2.1046, § 27.50	12	compliant
2	Modulation Characteristics	§ 2.1047, § 2.201	15	compliant
3	Occupied Bandwidth	§ 2.1049	16	compliant
4	Spurious Emissions at Antenna Terminals	§ 2.1051, § 2.1057, § 27.53	17	compliant
5	Field Strength of Spurious Radiation	§ 2.1053, § 2.1057, § 27.53	23	compliant
6	Frequency Stability	§ 2.1055, § 27.54	25	compliant

Table 1-1: Results – Summary

In accordance with the FCC Rule §15.3 (z) the equipment was tested with the limits that are valid for an *unintentional radiator*.

Stephane Nakpane	Editor

4 Equipment Under Test

The tested equipment is representative for serial production.

4.1 Description of EUT

The BTS performs the radio function of the Base Station System (BSS), and is connected to the Radio Network Controller (RNC) via the Iub interface, and to Mobile Stations (MS) via the Air interface (Antenna). The RNC is further connected to Serving GPRS Support Node (SGSN) or it can be connected to the Mobile Switching Centre (MSC) via IWU (Inter Working Unit).

4.2 Configuration of EUT

The used different EUT configurations are shown by the following tables.

Module Type	Flexi Multiradio BTS RF module 1.7/2.1GHz Flexi WCDMA BTS RF module 1.7/2.1GHz	
Radio Access Technology	UTRA	
Frequency Bands	**Uplink**	**Downlink**
Block A:	1710 – 1720 MHz	2110 – 2120 MHz
Block B:	1720 – 1730 MHz	2120 – 2130 MHz
Block C:	1730 – 1735 MHz	2130 – 2135 MHz
Block D:	1735 – 1740 MHz	2135 – 2140 MHz
Block E:	1740 – 1745 MHz	2140 – 2145 MHz
Block F:	1745 – 1755 MHz	2145 – 2155 MHz
	Single Carrier	**Multi Carrier**
Rated Output Power (Prat)	60 W (Config. A and C)	2x30 W (Config. B)
	RX	**TX**
Number of Antenna Ports	6 (RX1 to RX6)	6 (TX1 to TX6)
MiMo	Yes	Yes

Table 4-1: Overview of EUT Configuration

The tests were performed with one EUT at the antenna ports TX1 and/or TX2.

The used different EUT configurations are shown by the following table.

Module Name	**Serial-No.**	**Module Type**	**Config.**
FRIE	L9103100256	RF module	A, B, C
FRIE	L9103100255	RF module	A, B, C
Other Modules	**Module Type**		**Config.**
FSME	System module		A, B, C
FSME	System module		C
FTLB	Transmission module		A, B

Table 4-2: Configuration of EUT

For a functional description of the modules, please refer to the appropriate related parts and exhibit sections of this certification application.

4.3 Operating Conditions

If not stated otherwise, the following standard setup procedure for the EUT was used:

Setup for testing single carrier:
The transmitter was set up according to 3GPP TS 25.141 Test Model 1, 5 and 6 for all tests.

Test model 1:
64 DPCHs at 30 ksps (SF=128) distributed randomly across the code space, at random power levels and random timing offsets, were defined to simulate a realistic operating scenario which may have high PAR (Peak-to-Average Ratio).

Test model 5:
TX1: 30 DPCHs at 30 ksps (SF=128) together with 8 HS-PDSCHs at 240 ksps (SF=16). Each DPCH is modulated by QPSK and each HS-PDCH is modulated by 16QAM modulation.
TX2: 8 HS-PDSCHs at 240 ksps (SF=16) modulated by 16QAM.

Test model 6:
30 DPCHs at 30 ksps (SF=128) together with 8 HS-PDSCHs at 240 ksps (SF=16). Each DPCH is modulated by QPSK and each HS-PDCH is modulated by 64QAM modulation.

Setup for testing multi carrier:
The transmitter was set up according to 3GPP TS 25.141 Test Model 1, 5 and 6 for all tests.

Test model 1:
32 DPCHs at 30 ksps (SF=128) distributed randomly across the code space, at random power levels and random timing offsets, were defined to simulate a realistic operating scenario which may have high PAR (Peak-to-Average Ratio).

Test model 5:
TX1: 14 DPCHs at 30 ksps (SF=128) together with 4 HS-PDSCHs at 240 ksps (SF=16). Each DPCH is modulated by QPSK and each HS-PDCH is modulated by 16QAM modulation.
TX2: 4 HS-PDSCHs at 240 ksps (SF=16) modulated by 16QAM.

Test model 6:
30 DPCHs at 30 ksps (SF=128) together with 8 HS-PDSCHs at 240 ksps (SF=16). Each DPCH is modulated by QPSK and each HS-PDCH is modulated by 64QAM modulation.

The Flexi Multiradio BTS was supplied with 48 V DC.

During the measurements, one carrier channel was tested at a time. The carrier was set to the maximum power level to ensure the maximum emission amplitudes during all measurements.

During the tests, the Flexi Multiradio BTS is transmitting a pseudo random bit pattern on the data channels. This ensures that the measurements of the emission characteristics of the transmitter are pursuant to § 2.1049.

4.4 Compliance Criteria

The EUT must fulfil the requirements (described in the specifications mentioned in chapter 2.1, Specifications) for the selected test cases.

5 General Description of Tests

5.1 Tested Carrier Frequencies

The measurements were performed on 3 carrier frequencies, according to the following table:

Frequency [MHz]		Remark
Single carrier	Multi carrrier	
2112.4	2112.4 and 2117.4	lowest possible carrier frequency
2132.6	2132.6 and 2137.6	frequency at the middle of the band
2152.6	2152.6 and 2147.6	highest possible carrier frequency

Table 5-1: Carrier Frequencies

5.2 Modulation Characteristics

The EUT supports QPSK, 16QAM and 64QAM modulation. The modulation characteristic is defined in standard 3GPP TS 25.213.

5.3 Test Configuration

If not stated otherwise, the following measurement configuration was used to perform all measurements (see figure below).

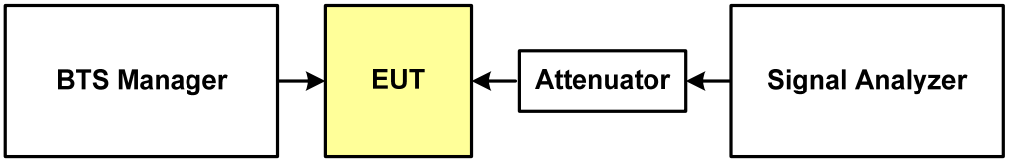

Figure 5-1: Test Configuration

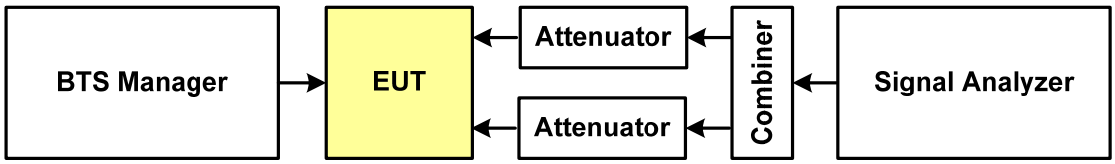

Figure 5-2: Test Configuration combined output

The RF output of the transceiver (cell) under test is connected to a signal analyzer via a high power attenuator to protect the input of the signal analyzer from high RF power levels. A description of the analyzer settings is given in each of the sections describing the measurements. The other transceivers are terminated.

A complete list of the measurement equipment is included on page 28 of this measurement report.

5.4 Calibration of the Test Equipment

All relevant test equipment has a valid calibration from an external calibration laboratory. Additionally the signal analyzer has a built-in self-calibration procedure. This calibration procedure was activated prior to the measurements so that the analyzer is deemed accurate. High quality cables were used to connect the measurement equipment to the EUT. The actual loss of the attenuator and the cables was measured with a high precision network/signal analyzer and taken into account for all measurements.

6 Test Results

6.1 Test No. 1: RF power output (§ 2.1046, § 27.50)

6.1.1 Purpose

The RF power output measurements were performed pursuant to § 2.1046 in order to determine the base station maximum RF power output.

6.1.2 Limits

According to § 27.50, base stations are limited to 1640 watts/MHz peak E.I.R.P (when transmitting with an emission bandwidth greater than 1 MHz).

6.1.3 EUT Operating Condition

The standard setup procedure as described in section 4.3 of this report was used.

6.1.4 Test Configuration

The test configuration used is described in section 5.3 of this report.

6.1.5 Test Procedure and Results

CDMA Per ANSI/J-STD-014,
TDMA Per ANSI/J-STD-010

Detachable Antenna:
The peak power at antenna terminals is measured using an in-line peak power meter or a signal analyzer.

Using a signal analyzer the RF power is measured with a frequency sweep across the carrier (see screenshots). The carrier power is calculated from the signal analyzer by integration over the result. The base station maximum output power is the sum of the measured carrier power and the external attenuation (cable loss of the test set up).

The following table shows the measured output powers at the antenna connector. Screenshots of the measurements are included on pages 29 of this report.

Config A:

Carrier Frequency	RF Power Output		Result
[MHz]	[dBm]	[W]	
QPSK-Modulation TX1			
2112.4	47.80	60.26	compliant
2132.6	47.91	61.80	compliant
2152.6	47.88	61.38	compliant
16QAM-Modulation TX1			
2112.4	47.85	60.95	compliant
2132.6	48.04	63.68	compliant
2152.6	48.00	63.10	compliant

2152.6	2147.6	45.12	32.51	45.16	32.81	48.15	65.32	compliant
Measurement Uncertainty:					±0.3dB			

Table 6-2: Results – RF Power Output – Multi carrier

The base station maximum RF power output was found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

6.2 Test No. 2: Modulation Characteristics (§ 2.1047, § 2.201)

The occupied bandwidth was measured to be 5.0 MHz, which represents the 99% power bandwidth (see the following section and screenshots on pages 37). Therefore, the modulation characteristic of the base stations transceiver is **5M00F9W**.

No further testing is required under this section of the FCC rules. No measurements other than the occupied bandwidth are required.

The modulation characteristics were found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

6.3 Test No. 3: Occupied Bandwidth (§ 2.1049)

6.3.1 Purpose

The measurements are performed to determine the occupied bandwidth of the EUT pursuant to § 2.1049.

6.3.2 Limits

According to § 2.1049 the 99% occupied bandwidth is the width of a frequency band such that, below the lower and above the upper frequency limits, the mean powers emitted are each equal to 0.5% of the emitted power.

6.3.3 EUT Operating Condition

The standard setup procedure as described in section 4.3 of this report was used.

6.3.4 Test Configuration

The test configuration used is described in section 5.3 of this report.

6.3.5 Test Procedure and Results

The 99% occupied bandwidth of the carrier emission is measured using a signal analyzer with Resolution Bandwidth set to set to 30kHz (less than 1% of bandwidth) (see screenshots on pages 37 for details). The following table summarizes the results:

Config A:

Carrier Frequency [MHz]	Occupied Bandwidth [MHz]	Result
QPSK-Modulation TX1		
2112.4	4.1506	compliant
2132.6	4.1506	compliant
2152.6	4.1667	compliant
16QAM-Modulation TX1		
2112.4	4.1346	compliant
2132.6	4.1506	compliant
2152.6	4.1667	compliant
16QAM-Modulation TX2		
2112.4	4.1506	compliant
2132.6	4.1506	compliant
2152.6	4.1667	compliant
64QAM-Modulation TX1		
2112.4	4.1667	compliant
2132.6	4.1506	compliant
2152.6	4.1667	compliant
Measurement Uncertainty:		±38kHz

Table 6-3: Results – Occupied Bandwidth – Single carrier

The occupied bandwidth was found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

6.4 Test No. 4: Spurious Emissions at Antenna Terminals (§ 2.1051, § 2.1057, § 27.53)

6.4.1 Purpose

The measurements of the spurious emissions at the equipment output terminals were performed pursuant to § 2.1051 in order to verify that all emissions are below the limits given by § 27.53.

6.4.2 Limits

Compliance with § 27.53 requires that any emission be attenuated below the transmitter power by at least 43 + 10 $\log_{10}$ P (P = transmitter power in Watts).

The compliance limit was calculated in the following way:

Maximum transmitter output power [W]:	P
Maximum transmitter output power [dBm]:	30 + 10 $\log_{10}$ P (conversion from W to dBm)
Attenuation required by FCC:	43 + 10 $\log_{10}$ P

Compliance limit = Maximum transmitter output power - Required attenuation
= 30 + 10 $\log_{10}$ P - (43 + 10 $\log_{10}$ P) = -13 dBm

6.4.3 EUT Operating Condition

The standard setup procedure as described in section 4.3 of this report was used.

6.4.4 Test Configuration

The test configuration used is described in section 5.3 of this report.

6.4.5 Test Procedure and Results

Signal analyzer settings:
The tests were carried out in accordance with § 27.53. For all frequency ranges except two (the one immediately below and the one immediately above the carrier frequency block) a 1 MHz resolution bandwidth was used for the measurements.
In the 1 MHz frequency bands immediately outside and adjacent to the carrier frequency block a resolution bandwidth is lowered to 1% of the 26 dB occupied bandwidth of the transmitted carrier and at minimum to 30kHz.
Note: Lower and upper band edge measurement with single carrier when TX1 + TX2 were summed, resolution bandwidth was reduced to 30kHz.
30kHz is <1% of the emission BW (4.2MHz between the 26dB points). To compensate the reduced measurement bandwidth, the limit was adjusted with 1.5dB to -14.5dBm.

According to § 2.1057, all emission including the fundamental frequency of the transceiver and all frequencies up to the 10th harmonic were investigated.

The following tables summarize the worst case detected emission levels (see screenshots on pages 40 for details). The external attenuation (cable loss of the set up) is already added in the results. It can be seen separately as the 'Offset' value in the screenshots.

Config A:

Carrier Frequency: 2112.4 MHz			
Frequency Range [MHz]	**Emission Frequency [MHz]**	**Maximum Emission Level [dBm]**	**Result**

Table 6-12: Results - Spurious Emissions – Multi Carrier 3rd order IM (Inband)

The measured conducted emission levels were found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

6.5 Test No. 5: Field Strength of Spurious Radiation (§ 2.1053, § 2.1057, § 27.53)

6.5.1 Purpose

The measurement of spurious radiated emissions was performed pursuant to § 2.1053 and § 2.1057 to verify that the field strength of any spurious emissions radiated directly from the cabinet, control circuits, power leads or intermediate circuit elements are attenuated below the transmitter power P by at least 43 + 10 $\log_{10}$ (P in Watts) dB as is required by § 27.53 (Emission limits).

6.5.2 Limits

Compliance with § 27.53 requires that all spurious emissions be attenuated below the transmitter power by at least 43 + 10 $\log_{10}$ P (P = rated maximum transmitter output power in Watts).

The compliance limit was calculated as per the following table:

Rated maximum transmitter output power:	60.0 W (= 47.78 dBm)
Required attenuation:	43 + 10 $\log_{10}$ 60.0 = **60.78 dB**

According to § 2.1057, all emissions to the 10th harmonic were investigated.

6.5.3 EUT Operating Condition

The standard setup procedure as described in section 4.3 of this report was used.

6.5.4 Test Configuration

The measurements were performed in an anechoic chamber. The radiated test site complies with the site attenuation requirements listed in ANSI C63.4 2003 and is listed with the FCC.

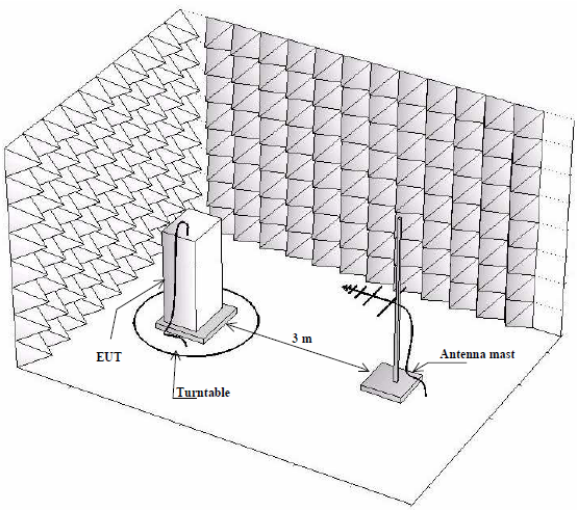

Figure 6-1: Test Configuration

Photographs of the EUT in the anechoic chamber are shown on page 69 of this measurement report.

6.5.5 Test Procedure

TIA/EIA-603-C-2004, Section 2.2.12
The test was performed in a semi-anechoic shielded room. The EUT was placed on a non-conductive 0.8 m high table standing on the turntable. During the test in the frequency range 30 – 22000 MHz the distance from the EUT to the measuring antenna was 3 m. In order to find the maximum levels of the disturbance radiation the angle of the turntable, the height of the measuring antenna were varied during the tests. The test was performed with the measuring antenna being both in horizontal and vertical polarizations.

Vertical and horizontal polarizations in the frequency range 30 – 22000 MHz was first measured by using the peak detector. During the peak detector scan the turntable was rotated from 0° to 360° with 30° step with the antenna heights 1.0 m and 2.5 m.

The limit of -13 dBm has been calculated to correspond 84.4 dB (µV/m).
Spurious emissions closer than 20 dB to the limit was measured with average detector.

The antenna substitution method was used to determine the equivalent radiated power at spurious frequencies. The EUT was replaced with a reference substitution antenna with a known gain referenced to an isotropic radiator $G_{Antenna[dBi]}$. This antenna was fed with a signal at the spurious frequency $P_{Gen[dBm]}$. The level of the signal was adjusted to repeat the previously measured level. The resulting
EIRP is the signal level fed to the reference antenna corrected for gain referenced to an isotropic.
The formula below was used to calculate the EIRP of the EUT.

$$P_{EIRP[dbm]} = P_{Gen[dBm]} - L_{Cable[dB]} + G_{Antenna[dBi]}$$

6.5.6 Test Results & Limits

Worst case detected emission levels are reported in the following table (refer to spectral plots included on pages 69 for details). The antenna factor and cable loss is according to the manufacturer's specification.

Config C:

Frequency	Maximum Emission Level	Result
[MHz]	[dBm]	
All	More than 20dB below limit -13 dBm	compliant
Measurement Uncertainty:		±5.4dB

Table 6-13: Results – Field Strength of Spurious Radiation – Single carrier

The measured emission levels were found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

6.6 Test No. 6: Frequency Stability (§ 2.1055, § 27.54)

6.6.1 Purpose

Frequency stability measurements were performed to verify that the frequency deviation of the emission stays within the licensee's frequency block under extreme temperature conditions (-30°C to +50 °C) according to § 2.1055.

6.6.2 Limits

According to § 27.54, the frequency of the fundamental emission is required to stay within the authorized frequency block, independent of the ambient temperature.

6.6.3 EUT Operating Condition

The standard setup procedure as described in section 4.3 of this report was used.

6.6.4 Test Configuration

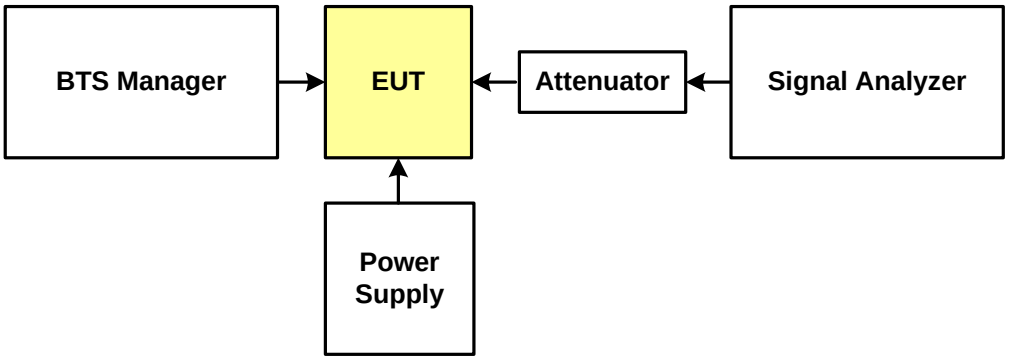

Figure 6-2: Test Configuration for frequency stability with voltage variation

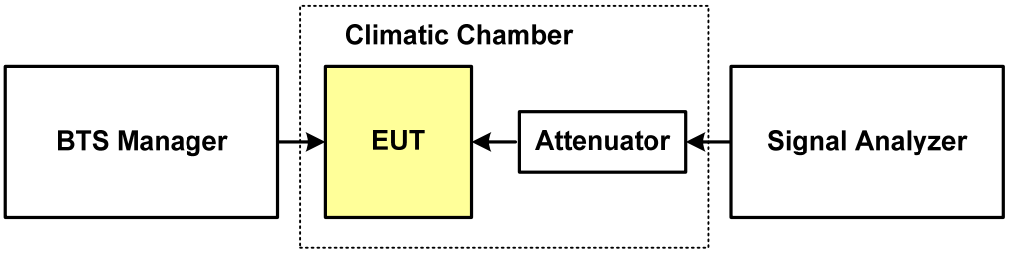

Figure 6-3: Test Configuration for frequency stability with temperature variation

A complete list of the measurement equipment is included on page 28 of this measurement report.

6.6.5 Test Procedure and Results

Frequency Stability with Temperature Variation: The input voltage to the E.U.T. is set to S.T.V. and the temperature of the environmental chamber is varied in 10 degree steps from -30 degrees celsius to +50 degrees celsius. The E.U.T. is allowed to stabilize at each temperature and the frequency error is measured.

Table 7-1: Part List of the RF Measurement Test Equipment

7.2 Spectral Plots

7.2.1 Test No. 1: RF Power Output

The value ‘CH PWR’ is the carrier power measured by the signal analyzer. ‘REF PWR’ (and also ‘Offset’) is the external attenuation (cable loss of the test set up). The sum of both values is base station maximum output power given on page 12. The external attenuation is frequency dependant. Thus the various ‘Offset’ values in the screenshots may differ.

7.2.5 Test No. 5: Field Strength of Spurious Radiation

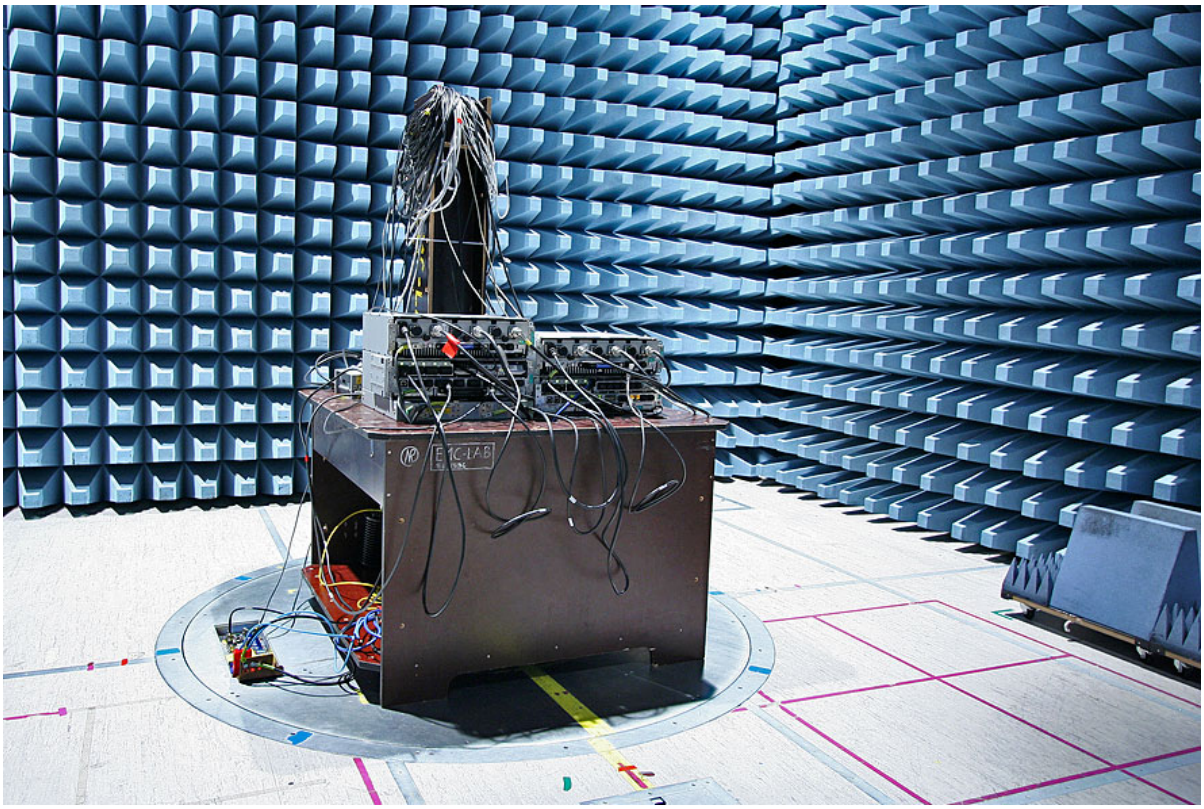

Figure 7-72: Photograph of the anechoic chamber with the EUT

Config C:

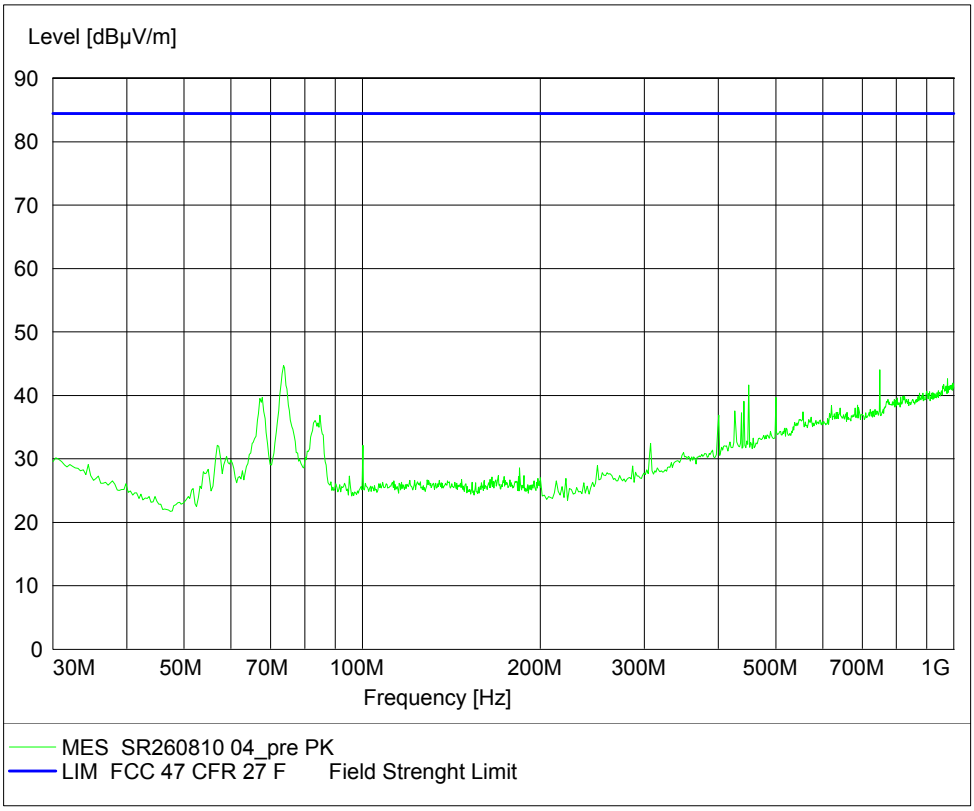

Figure 7-73: Radiated Emission 30 MHz –1GHz

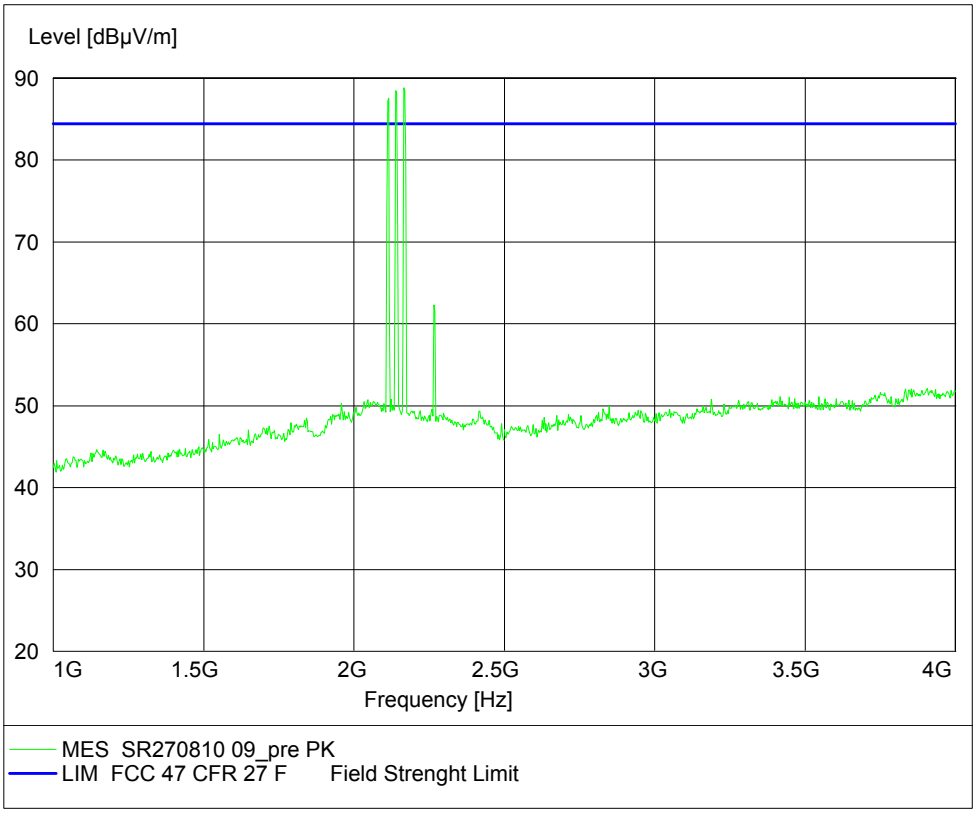

Figure 7-74: Radiated Emission 1 GHz – 4GHz

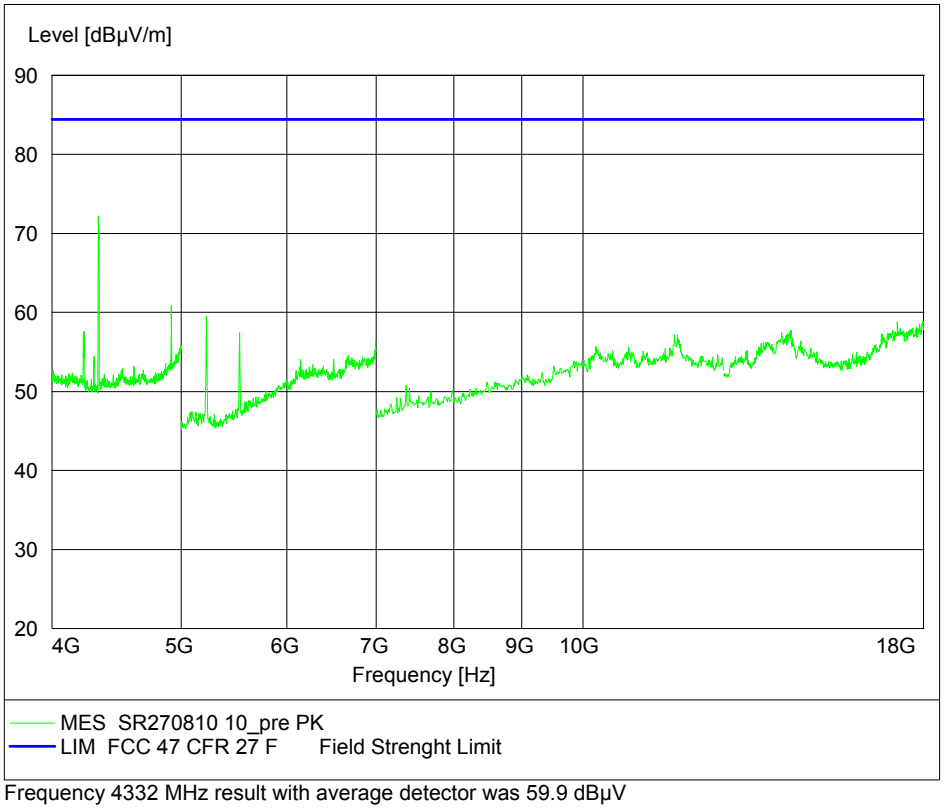

Frequency 4332 MHz result with average detector was 59.9 dBµV

Figure 7-75: Radiated Emission 4 GHz – 18GHz

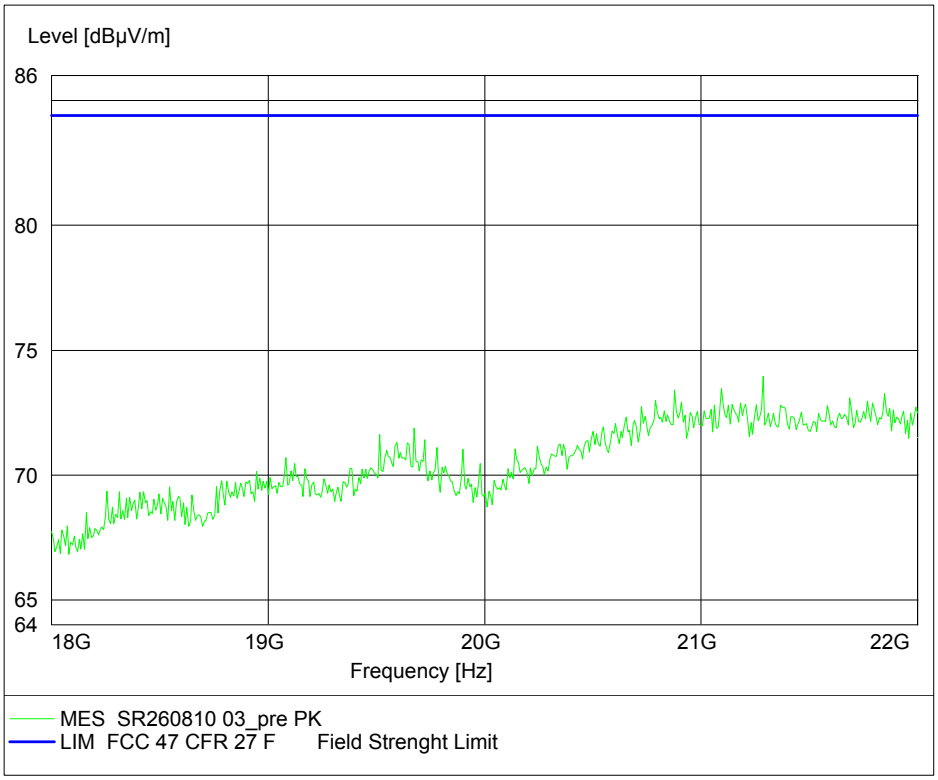

Figure 7-76: Radiated Emission 18 GHz – 22 GHz

Note: The frequencies shown on the plot were used for the spurious emission measurements using the 'dipole substitution method'.
