Tune up procedure over power range according to section 2.1033© (9):

1.Adjustment procedure for the transmitter in order to insure it is transmitting at 72MHz. The transmitting frequency is fixed by crystal(72.050,72.150,72.212. MHz) circuit. We set TX module to lock only for crystal circuit. So it is impossible to transmitting other frequencies with crystalset.

2.Tune up the power of the transmitter by modulating. Measured maximum power is 25 mW.
