## **4. Operation and Monitoring of the EUT during Testing**

### **4.1. Operating Modes**

The EUT was tested in the following operating mode(s):

- Transmit Mode with/without modulation as required at highest output power.
- Baud Rates were 4800 bps for 12.5kHz Channel Spacing and 9600 bps for 25kHz Channel spacing.
- Receive Mode.

### **4.2. Configuration and Peripherals**

The EUT was tested in the following configuration(s):

- No AC conducted tests were performed as the EUT is battery powered.
- For GMSK and FFSK modulation, the EUT was connected to a laptop. A bespoke application on the laptop pc was used to configure the EUT during the testing.
- For the external data and voice modulation test, the EUT was connected to a laptop via test service box. The test service box was also connected to a signal generator which was swept over a wide audio frequency range in order to ascertain the maximum deviation/or modulation bandwidth.
- For radiated emissions testing the antenna port was terminated with the antenna supplied with the product.
- For conducted and radiated emissions out of band testing, preliminary checks were made on all four modulation schemes. The mode which exhibited the highest emissions profile with regards to amplitude (i.e. FFSK) was scanned across the required measurement frequency range. Where an emission was detected final emission measurements were performed on all four modulation schemes and two channel spacing on bottom, middle and top channel. Receiver scans were done to  $5 \times 500\text{MHz} = 2.5\text{GHz}$  and the Transmitter tests were performed to  $10 \times 500\text{MHz} = 5\text{GHz}$
- The EUT is rated to transmit from 1Watt to 5Watts. Preliminary tests were performed for each test case in order to ascertain the worse case mode of operation regards power, emissions and bandwidth. It was found that maximum power was the worse case mode of operation on all accounts and thus this report reflects the results for maximum power mode only.

## **5. Measurements, Examinations and Derived Results**

### **5.1. General Comments**

Measurement uncertainties are evaluated in accordance with current best practice. Our reported expanded uncertainties are based on standard uncertainties, which are multiplied by an appropriate coverage factor to provide a statistical confidence level of approximately 95%. Please refer to *Section 6. Measurement Uncertainty* for details.

**5.2.12. Transmitter Transient Frequency Behaviour****Test Summary:**

<b>FCC Part:</b>	FCC 90.214
<b>Test Method:</b>	Tested in accordance with EIA/TIA-603-C Clause 2.2.19 and 3.2.19

**Environmental Conditions:**

<b>Temperature (°C):</b>	23
<b>Relative Humidity (%):</b>	28

**Results: Bottom Channel / 12.5 kHz Channel Spacing**

Time Intervals	Frequency Difference (kHz)
	Single Channel
t1	3.3
t2	0.4
t3	2.6

**Results: Bottom Channel / 25 kHz Channel Spacing**

Time Intervals	Frequency Difference (kHz)
	Single Channel
t1	12.0
t2	0.7
t3	5.2

**Note(s):**

1. Preliminary testing was performed on all three channels and the worse case channel was found to be the bottom channel which was thus selected for final measurements.

## 6. Measurement Uncertainty

No measurement or test can ever be perfect and the imperfections give rise to error of measurement in the results. Consequently the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

The uncertainty of the result may need to be taken into account when interpreting the measurement results.

The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor such that a confidence level of approximately 95% is maintained. For the purposes of this document “approximately” is interpreted as meaning “effectively” or “for most practical purposes”.

Measurement Type	Range	Confidence Level (%)	Calculated Uncertainty
Radiated Spurious Emissions	30 MHz to 1000 MHz	95%	±5.26 dB
Radiated Spurious Emissions	1 GHz to 5 GHz	95%	±2.94 dB
Maximum Output Power	30 MHz to 1 GHz	95%	±0.27 dB
Occupied Bandwidth	Not applicable	95%	±0.92 ppm
Conducted Emissions	9 kHz to 5 GHz	95%	±2.62 dB
Frequency Stability	Not applicable	95%	±0.92 ppm
Transient Frequency Behaviour	Not applicable	95%	±0.32% (Amplitude) ±3.53nS (Time)

The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty the published guidance of the appropriate accreditation body is followed.
