3.0 Test Results

3.1 Field Strength of Fundamental Emissions

Test Requirement: FCC 47CFR 95.639
Test Method: TIA 603
Test Date: 2008-10-08
Mode of Operation: Tx mode

Test Method:

- 1) The EUT was placed 0.8m above the ground plane of semi-anechoic Chamber*. Measurements in both horizontal and vertical polarities were performed. During the test, EUT output power was maximized by: having the EUT continuously working, rotating turntable, varying antenna height from 1m to 4m in both horizontal and vertical polarizations.
- 2) The EUT is replaced by a substitution antenna (positioned at the EUT's phase or volume center), which is connected to a signal generator. The signal is again 'peaked' and the signal generator output adjusted until the level, noted in step one, is again measured on the receiving device. This signal generator output level is shown in Test Results of the following page.

*: Semi-anechoic chamber located on the G/F of HKSTC with a metal ground plane filed with the FCC pursuant to section 2.948 of the FCC rules, with Registration Number: 607756.

3.2 Field Strength of Spurious Emissions

Test Requirement:	FCC 47CFR 95.635
Test Method:	TIA 603
Measurement Distance:	3m (Semi-Anechoic Chamber)
Frequency range:	30MHz – 1GHz for transmitting mode Test instrumentation resolution bandwidth 120kHz (30MHz – 100MHz)
Test Date:	2008-10-08
Mode of Operation:	Receive antenna scan height 1-4m, polarization Vertical / Horizontal
Tuned Frequency:	72.010MHz, 72.490MHz & 72.870MHz

Test Requirement:

The power of each unwanted emission should be less than the transmitter power (TP) by at least $56+10\log$ (TP) on any frequency removed from the center of the authorized bandwidth by more than 250%.

Below 30MHz Test Procedure:

For testing performed with the loop antenna, testing was performed in accordance to TIA 603. The center of the loop was positioned 1m above the ground and positioned with its plane vertical at the specific distance from the EUT. During testing the loop was rotated about its vertical axis for maximum response at each azimuth and also investigated with the loop positioned in the horizontal plane.

Above 30MHz Test Procedure:

The procedure used was TIA603. The receiver was scanned from 30MHz to 1GHz. When an emission was found, the table was rotated to produce the maximum signal strength. An initial pre-scan was performed for in peak detection mode using the receiver. The EUT was measured for both the Horizontal and Vertical polarities and performed a pre-test three orthogonal planes. For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the normal rated supply voltage. The worst case emissions were reported.

3.4 Frequency Stability

Test Requirement:	FCC 47CFR 95.623
Test Method:	TIA 603
Test Date:	2008
Mode of Operation:	Tx Mode
Test Requirement:	All other R/C transmitters that transmit in the 72-76MHz frequency band must be maintained within a frequency tolerance of 0.002% (20ppm)

Test Method:

Frequency measurements were made as follows:

- (a) at 10 degree intervals of temperatures between -20°C and +55°C at the manufacturer's rated supply voltage, and
- (b) at +20°C temperature and $\pm 15\%$ supply voltage variations.
Note, for handheld equipment that is only capable of operating from internal batteries, reduce the primary supply voltage to the battery operating end point. The manufacturer should specify the battery operating endpoint voltage of the equipment.
