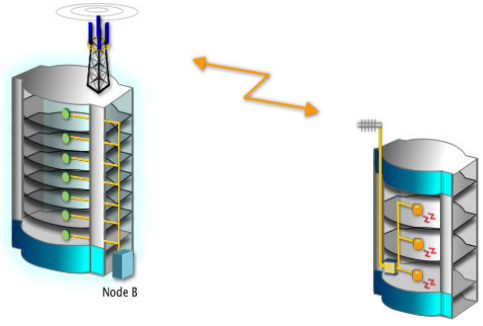
CONTENTS

1 System Outline

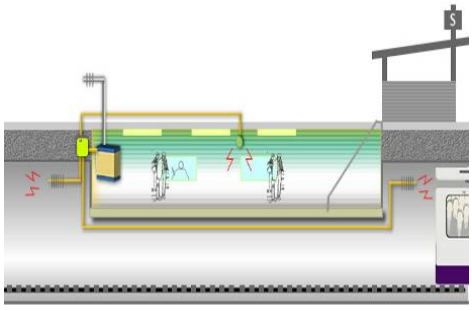
Mobile WiMAX operates at 2.5GHz frequency band and it offers wireless internet service at medium to low velocity movement without connection being cutoff. Mobile WiMAX guarantees mobility and due to inexpensive wireless internet access, it has become a necessary technology. Generally wireless infrastructures for radio waves are not serviceable in locations such as in-buildings, islands, mountain areas and shadow zones. To solve this problem, a repeater system is utilized. This mobile internet RF repeater system is an OFDMA mobile internet system that allows services in in-buildings such as offices, underground parking areas, shopping malls, sub-station locations and small scale areas. This system can provide coverage to shadow zones where radio waves can't penetrate. Some of these locations may be underground or indoor areas with dense traffic.

<Shadow Zones>

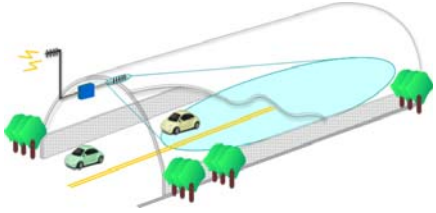
- Underground: subway, underground shopping mall, underground passage, underground car park, etc.
- Terrestrial: inside large building, tunnel, dense city centers, etc



<In-Building Application>



<Subway Application>



<Tunnel Application>

[Figure 1] MOBILE WIMAX System Outline

2 System Configuration

2.1 Mobile WiMAX

This mobile WiMAX system was developed so that signals could be retransmitted to shadow zones and thus provide service to these areas. Setup for this unit has become very common in indoor areas such as underground shadow zones.

Donor antenna and service antenna ports for the repeaters are configured to N-females while monitoring ports for repeaters are configured to SMA female.

In order for operator's to easily understand the repeaters operational status, Ethernet port is used so that units can be monitored and allow repairs to be easily made.

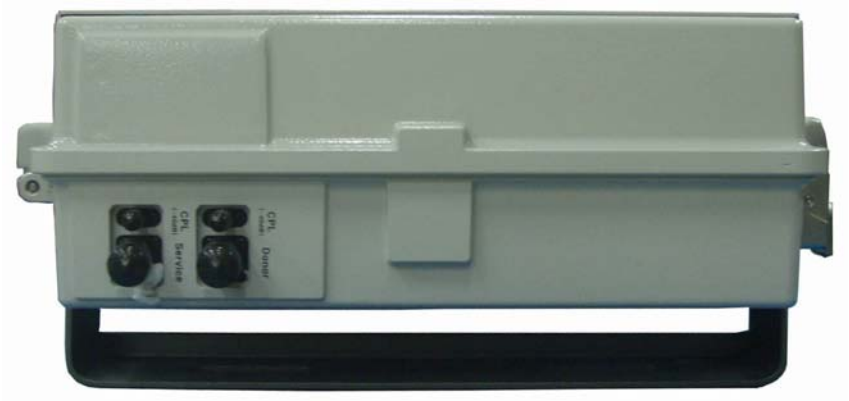
For 24dBm repeater: Maximum value of 24dBm/Total can be emitted for forward and reverse direction.

For 30dBm repeater: Maximum value of 30dBm/Total can be emitted for forward and reverse direction.

[Figure 2] Frontal view of Mobile WiMAX System

2.1.1 Base Station Direction (Donor ANT)

Connect the antenna cables to the donor antenna port which is located on the top section of the repeater. The donor antenna is installed outside on the building so that it will be able to receive signals from base station.



[Figure 3] Top view of MOBILE WIMAX System

2.1.2 Service Direction (Service ANT)

The service antenna port which is located at the top section of the repeater is connected to the service antenna cable. These antennas that are connected to the repeaters are able to provide service to the Shadow Zone and allow for a satisfactory smooth signal. So, in order to match site characteristics with an installation location, an antenna type has to be determined and connected.

2.1.3 UL CPL (Up Link Coupling)

Up link coupling is for operators to analyze the status of an Up Link path. It is a port for measuring UL signal waveform and strength.

[Figure 4] Bottom view of MOBILE WIMAX System

2.1.4 DL CPL (Down Link Coupling)

Down link coupling is for operators to analyze the status of a Down Link path. It is a port for measuring DL signal waveform and strength.

2.1.5 GUI

Communication is made between repeaters and the PC operation program via an RJ-45. The GUI confirms that the conditions of the repeater and status settings are made on the ports.

2.1.6 AC Power

Repeater’ s operational power supply is connected via an AC cable.

2.1.7 DC Battery

When the AC power supply is cutoff, DC +24V battery is implemented as the back up power source. (Option)

3 System Figures and Specifications

3.3.7.1 GENERAL CHARACTERISTIC

	Items	Specification	
Input	Input Voltage and Range	110 ~ 124 or 208 ~ 240VAC (Switch Selection)	
	Frequency	55 ~ 65Hz	
	Constant	Single Phase	
Output	Rated Voltage and Load Current	+27VDC/4A, +5.5VDC/8.2A, +7VDC/3A,-27VDC/0.1A	
	Voltage Fluctuation Limit	Rated Output Voltage ± Within 2% (Line/Load Regulation)	
	Ripple/Spike	Ripple, Spike inclusion, Output Voltage less than 1% of 10V which is within 100mV	
	Excess Voltage (Sudden Load Change)	Peak Value	Less than 1V
		Recovery Time	Less than 35msec
	Efficiency	More than 75%	
	Hold-up Time	Maintain more than 20msec	
	Over Voltage Protection	Output level of 110 ~140% Shutdown Protection	
	Over Current Protection	Maximum output current is between 110~140% for current limit. Auto return Sub-power for over current protection follows the elements characteristic.	
	Arrival Time Rating	For voltage rating, the arrival time is within 100 msecond. OVER&UNDER SHOOT voltage rating is within 90 ~ 110%	
	Time Drift	After 30 minutes of operation, when output voltage is measured, value should be within ± 0.25%	

	Over-Heating Protection	When PSU’s Base Plate exceeds 100 °C, system shuts down
	Interface Signal	AC ALM, DC ALM, +27V C/S, +27V V/S, BAT LOW ALM
	Indicator	AC LED/ DC LED/ ALM LED
	BATT. Terminal Voltage	+21V ±0.5V

4 System Structure and Function

4.1 Repeater Structure and Explanation

4.1.1 Repeater External Appearance

Repeater's enclosure prevents dust and other pollutant particles from entering and is designed for wall mount positioning. Heat-sink is placed to dissipate heat.

[Figure 5] Mobile WiMAX RF Repeater Structure

4.1.2 REPEATER INTERIOR

Structure of the unit is simplified so that maintenance will be easily handled; therefore the number of modules is minimized. Inside the repeater enclosure, there are 6 modules that are laid out. These modules are Switch, PSU, HPA, BPF, UDC and Controller.

[Figure 6] Mobile WiMAX Repeater’s Interior

4.2 Explanation of Internal Configuration

4.2.1 Switch Module

WIMAX DPDT (Double Pole Double Throw) RF Switch LNA is applied to the WIMAX RF repeater.

High Isolation values are used for Down Link and Up Link segregation (More than 120dB). With low insertion loss, Noise Figure value and HPA output loss can be lowered. When TTL sync is high, downlink path is set and when TTL sync is low, Up Link path is set.

[Figure 7] Switch Module Feature

4.2.1.1 HPA

HPA is the input signal port for RF signals which travel out the Link and Service port.

4.2.1.2 LNA

Signals make their way into Link and Service ports, whereby weak signals are amplifie d and exit out of LNA OUT. Signals are then delivered to up/down converter’ s input port.

4.2.1.3 Service

Service port connects directly to BPF. Based on a switching mechanism, high

amplified signals enter into the HPA and exit its way out of the service port. The signal then gets filtered by BPF and travels toward the service antenna. When the switch module is in a different state, weak signals from the service antenna pass through the BPF and into the service port. These signals exit the LNA out port to be amplified.

4.2.1.4 Link

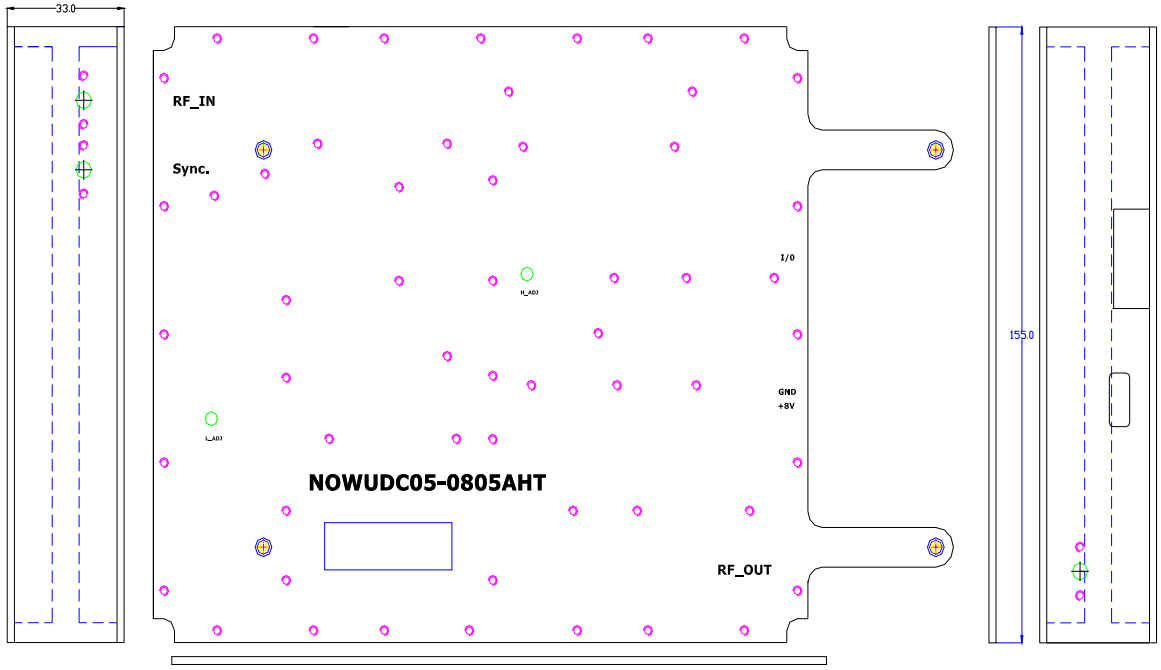
The Link port connects directly to BPF. Based on a switching mechanism, high amplifi ed signals enter into the HPA and exit its way out of the Link port. The signal then get s filtered by BPF and travels toward the donor antenna. When the switch module is in a different state, weak signals from the donor antenna pass through the BPF and into the Link port. These signals exit the LNA out port to be amplified.

4.2.2 UDC Module

4.2.2.1 RF Module

Mobile WiMAX signal is received at the LNA (Switch Module). The signal is down converted and passed through a SAW filter. Once any unwanted signals have been removed, it is up converted, amplified and then sent to the HPA (Switch module).

Digital variable attenuators are built into the repeater so full gain control can be performed for forward and reverse direction (As it handles duplex transmission).



[Figure 8] UDC Module Feature

4.2.3 BPF Module

These modules receive Mobile WiMAX signals from antennas outside. Only BRS-Band's are passed and signals are delivered to the switch module. These modules also receive output signals from the switch module of the HPA port and forward them to the antennas.

[Figure 9] BPF Module Feature

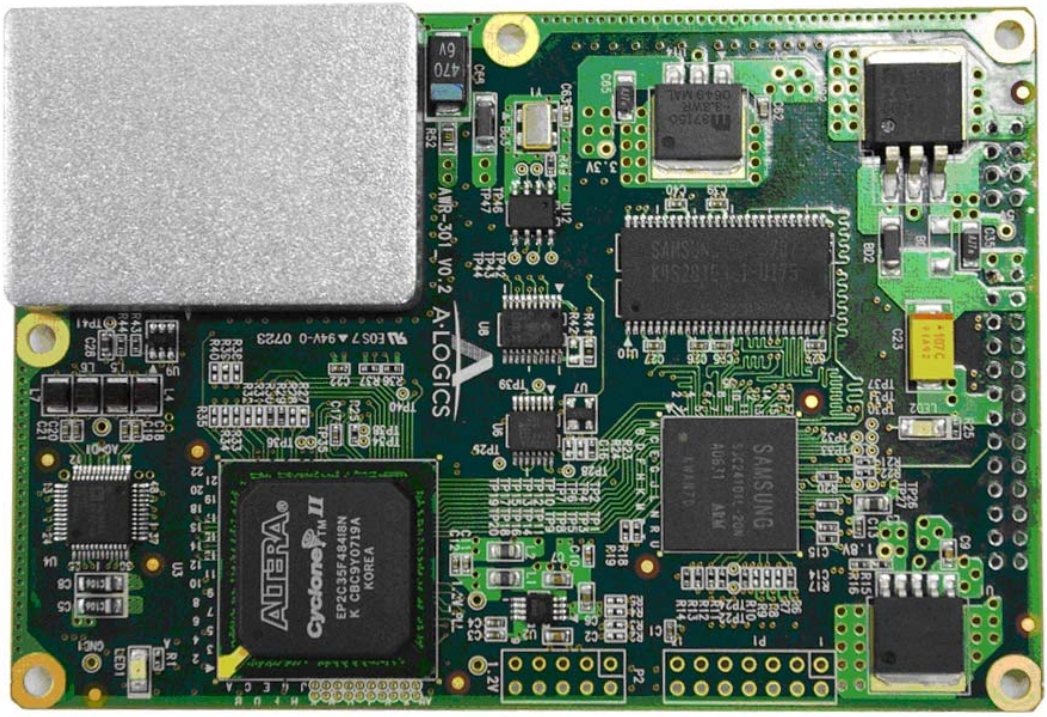
4.2.4 HPA MODULE

HPA module receives filtered and amplified mobile WiMAX signals from UDC module. These signals are then amplified to serviceable capacity and sent to the switch module.

[Figure 10] HPA Module Feature

4.2.5 SDM

TDD switching signal and repeater oscillation sensing functions are provided. In order to allow for TDD switching signal, synchronization detection and rate detection functions are set up. Also, oscillation sensing function is built in.



[Figure 11] SDM Feature

Characteristics of the functions that were implemented above are shown below.

Sync Detection
Cell search
Function: Searches for 114 Mobile WiMAX preambles and to detect Mobile WiMAX signals.

Preamble Detection
Function: For Cell search, tracking quality from detected preambles.

FA search
When cell search is unsuccessful in searching for a designated FA, FA is changed and cell search is executed again.

TDD Switch

Generation of 8 switching signal function

Rate Detection
FFT
Mobile WiMAX use, 1024 FFT function

Channel Estimation/Compensation
Reconstruction of Fading signal function

Frequency Offset Estimation/Compensation
AWR providing BB signals for RF frequency offset compensation function

Forward Error Correction
Convolution Code Decoder

Convolution Turbo Code Decoder

Minute Oscillation
Feedback Path detection

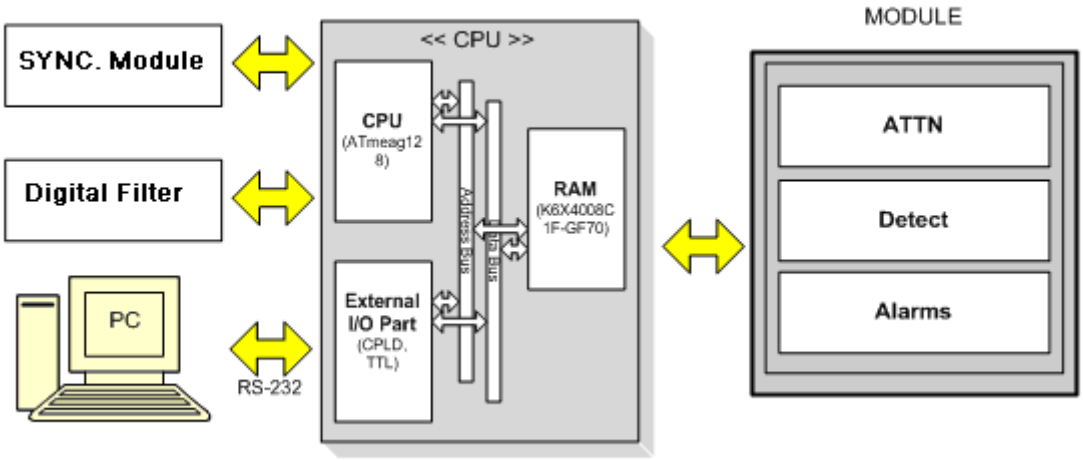
Additional Function
AGC
In order to improve AWR performance, AGC is provided for AWR’s input signal.

RSSI
Providing Preamble’s RSSI

4.2.6 Controller Module

Main NMS board includes the Mobile WiMAX repeater's CPU. For each sector, monitoring and control functions are performed.

4.2.6.1 Block Diagram



[Figure 12] Controller Block Diagram

4.2.6.2 CPU(Atmel ATmega128)

AVR mega series One-chip type CPU
Operating Frequency: 16 MHz
1Mbit Program Memory (Flash) built in
4kByte internal SRAM and 4kByte EEPROM built in for data back up use
2 Serial Port (UART) built in

4.2.6.3 PC and Communication Function

By utilizing PC's application programs, repeaters can monitor and control activities at the controller. PC will require a connection of 38400bps on a RJ-45 cable for communication.

4.2.6.4 Digital Module and Communication Function

Digital Module's status of monitoring and control can be performed.

4.2.6.5 Data Back Up Function

At the PC and notebook's key, controlled values are saved in the controller. Therefore when the repeater is powered off or reset, these set values will be maintained.

4.2.6.6 Attn Control Function

ATTN can be controlled.
All Attn setting ranges are 0~30 dB.

4.2.6.7 Power/Temperature Detect Function

For each module, analog inputs of power and temperature are converted to digital output. It is displayed in the PC and set values are executed for characteristic functions.

4.2.6.8 Alarm Check Function

For each module, output of all status information are collected and displayed in the PC. Afterwards, relevant functions can be performed.

4.2.7 PSU

In order to provide stable DC power from an AC power input, this power supply unit is utilized. AC 110 ~ 125 / 208 ~ 240Vac input (Switch is used) power is received and converted to SMPS (Switch Mode Power Supply) of +27V, +7V, +5.5V, -27V outputs.

[Figure 13] PSU Feature

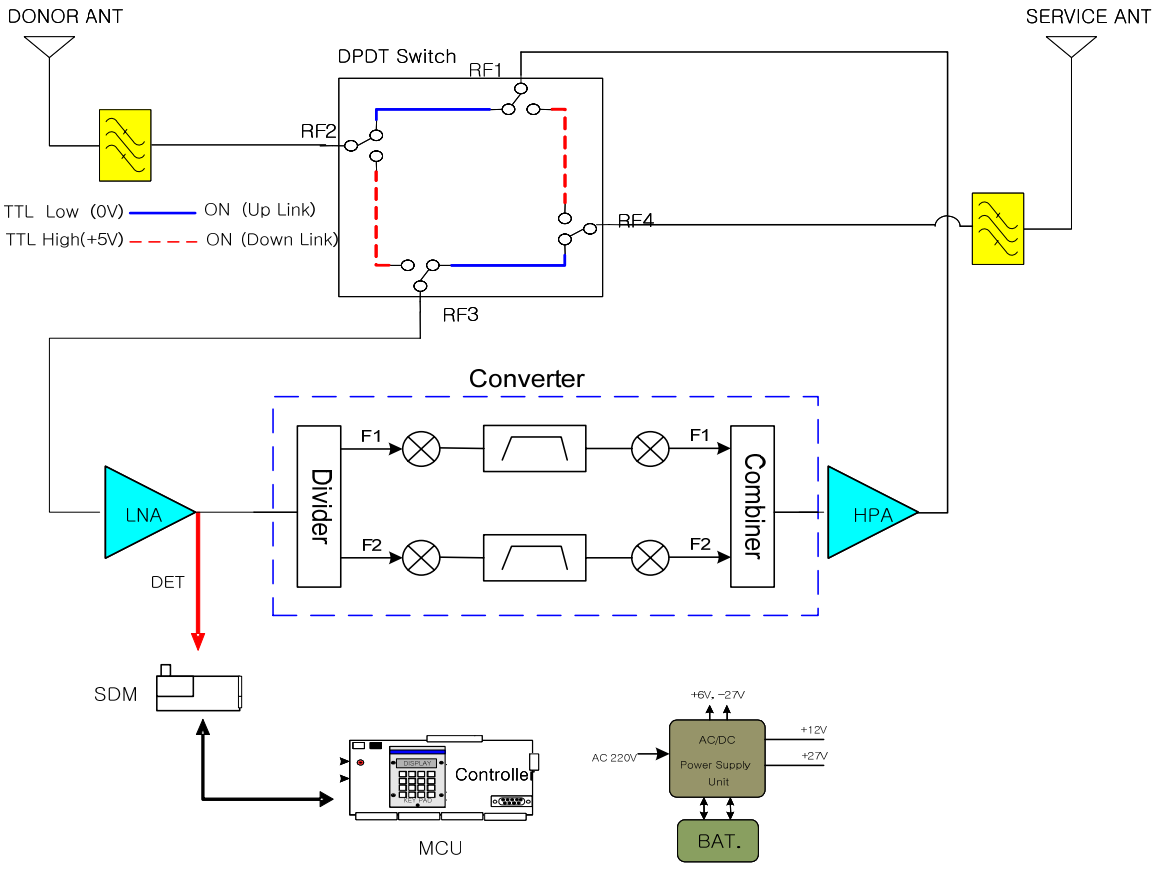
Main power supply unit's cooling method is by conduction cooling. The unit has been designed to meet all safety standards for dielectric structure; including dielectric potential and dielectric resistance characteristics. The power supply unit has been designed with a PWM switching for high efficiency and the switching frequency operates at 67 KHz ± 10 KHz. For all electrical characteristic testing, rated input, output conditions and components should be connected.

5 Signal Block Diagram and Signal Flow

5.1 System Block Diagram

In order to minimize the size of the device, we have implemented a design that is single pass and bi-directional serviceability.

A single pass repeater is small, simple and reduces the cost of the system. It also generates less heat and is light weight thus installation and maintenance becomes easy to handle. Single pass, bi-directional repeater's block diagram is shown below along with other components that have been implemented such BPF , RF Switch (DPDT), LNA, Converter and HPA Module.



[Figure 14] MOBILE WIMAX Repeater Block

5.1.1 Forward Direction Block Explanation

Signals from BTS are received via the repeater’s donor antenna. These signals are then filtered through the BPF (Band Pass Filter) and enter into the DPDT RF switch as inputs. Within the DPDT switch, down link and up link paths are switched alternately. In a down link switching state, signals are sent to LNA where low noise amplifications are applied and sent to the Up/Down Converter. At the converter, only the relevant bands are passed t hrough the SAW filter and forwarded to the HPA. HPA amplifies these signals to high outp ut and passes it through to the DPDT switch and BPF. The signals finally radiate out the s ervice antenna.

5.1.2 Reverse Direction Block Explanation

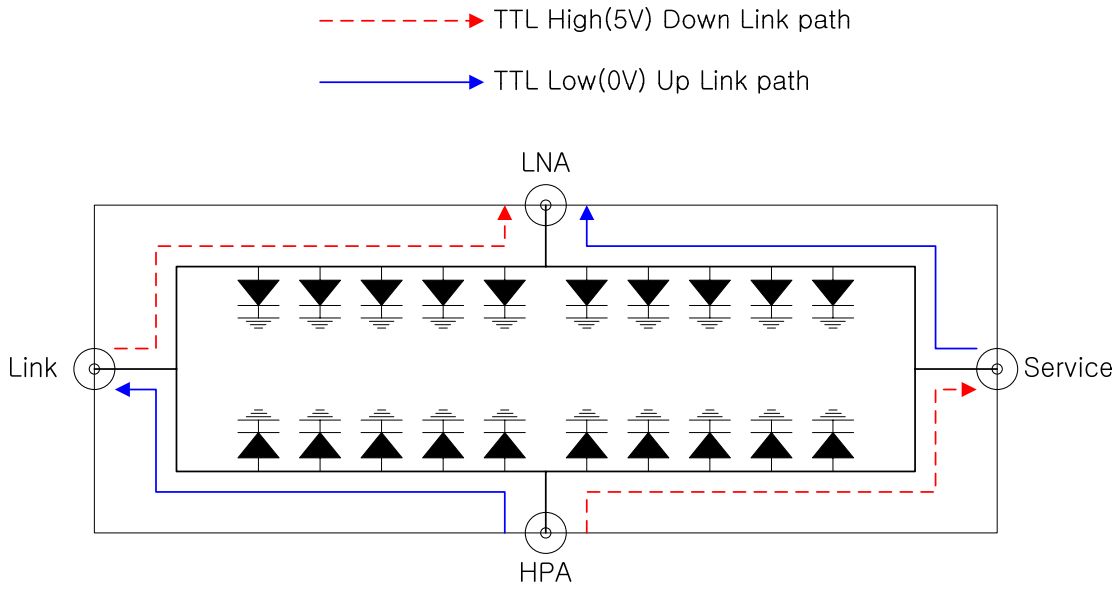
Signals from PSS (Portable Subscriber Station) are received via repeater’s service antenn a. These signals are then filtered through the BPF (Band Pass Filter) and enter into the DP DT RF switch as inputs. Within the DPDT switch, down link and up link paths are switched alternately. In an up link switching state, signals are sent to LNA where low noise amplifica tions are applied and sent to the Up/Down Converter. At the converter, only the relevant b ands are passed through the SAW filter and forwarded to HPA. HPA amplifies these signal s to high output and passes it through to the DPDT switch and BPF. The signals finally rad iate out the donor antenna.

5.2 UNIT MODULE BLOCK DIAGRAM

5.2.1 SWITCH MODULE BLOCK DIAGRAM

5.2.1.1 Like the figure below, switch module implements RF Switch (DPD T) and LNA into one module.

5.2.1.2 For Mobile WiMAX and TDD based systems, at a set given time, system will have to operate at one path and change moments later. Due to this characteristic for up link and down link signals, this module was developed specifically for this type of operation.

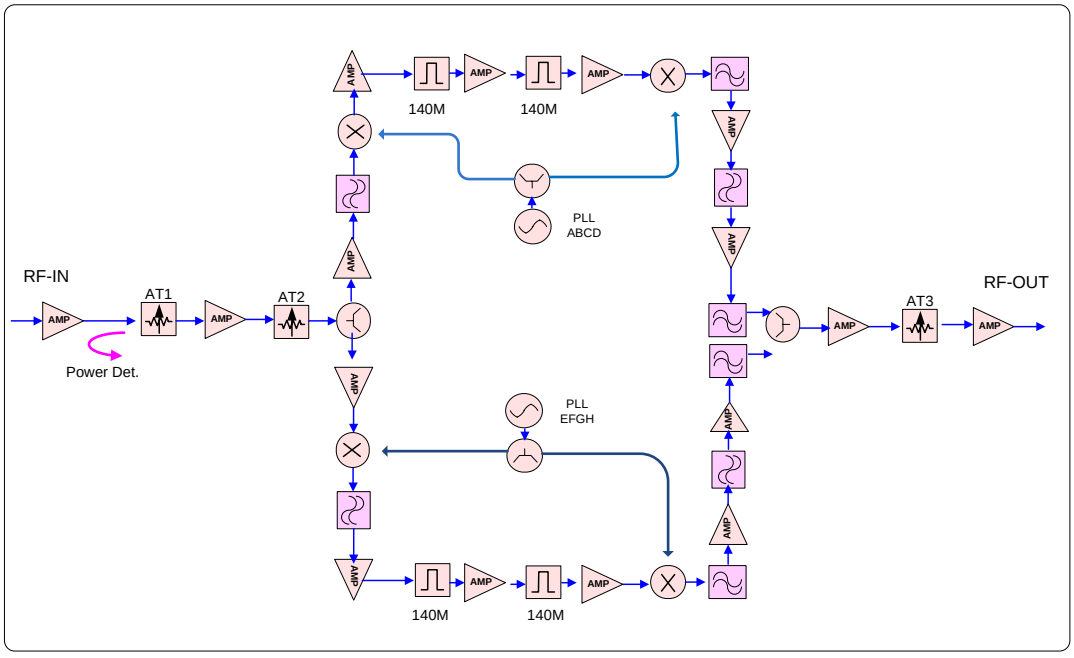


[Figure 15] Switch Module Block

5.2.2 UDC BLOCK DIAGRAM

5.2.2.1 RF MODULE

Like the figure below, the UDC (Up/Down Converter) module is configured to all of the repeater's functions such as gain control from attenuators, up and down conversion of frequency from PLL and mixer, filters that remove unwanted bands and amplified signals from amplifiers. UDC manages the role of filtering and amplifying received signals via LNA. Signals are sufficiently amplified by HPA so that it can be emitted out towards the BTS or PSS.

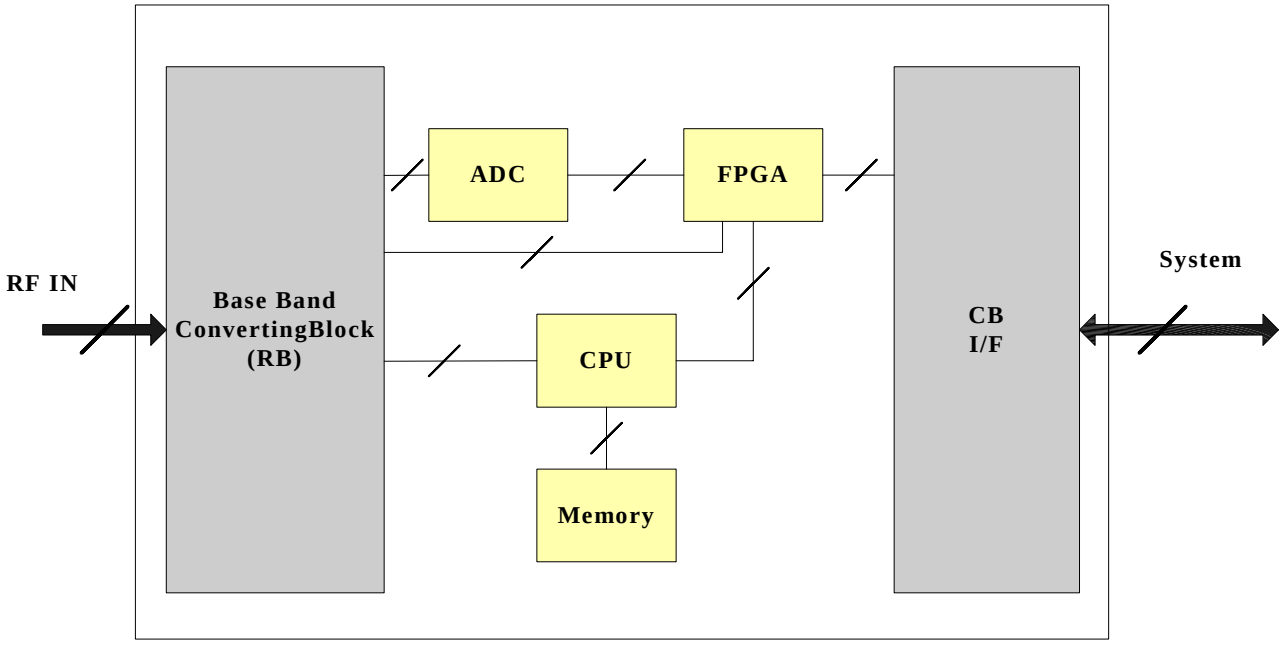


[Figure 16] UDC Block

5.2.3 SDM & CTRL BLOCK DIAGRAM

From the BTS, SDM (Sync. Detector Module) & CTRL (Control) modules receives signals and extracts TTG and RTG. Signals that control the DPDT switching is sent as IHS and system determines the direction of operation. Repeater determines the operation status and control features are performed in order for it to function smoothly.

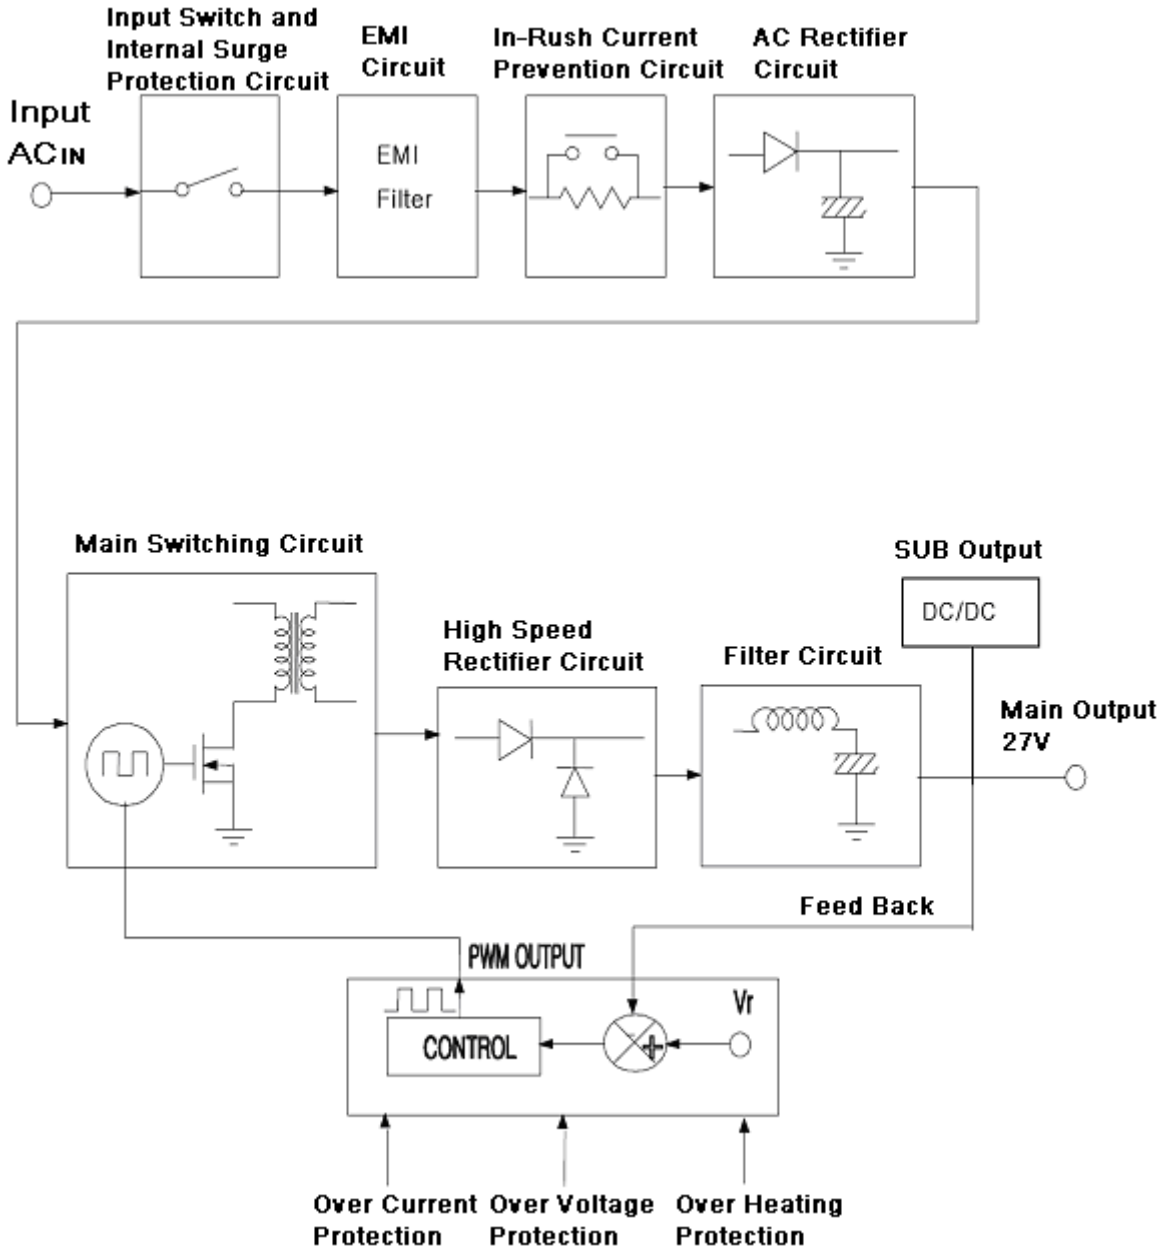
Via the GUI, status of the repeater can be determined on the PC. The repeater's status can also be sent via host's NMS.



[Figure 17] SDM Block

5.2.4 PSU BLOCK DIAGRAM

Repeaters running power for the power supply unit is AC 110 ~ 125 / 208 ~ 240Vac input (Switch used). Power is converted to DC and supplied to each component.



[Figure 18] PSU Block

6 SYSTEM GAIN BUDGET

6.1 DOWN LINK GAIN BUDGET

6.1.1 RF module and System's Link Budget is designed with the use of SysCalc simulation tool. Optimum results are shown below for down link Link Budget.

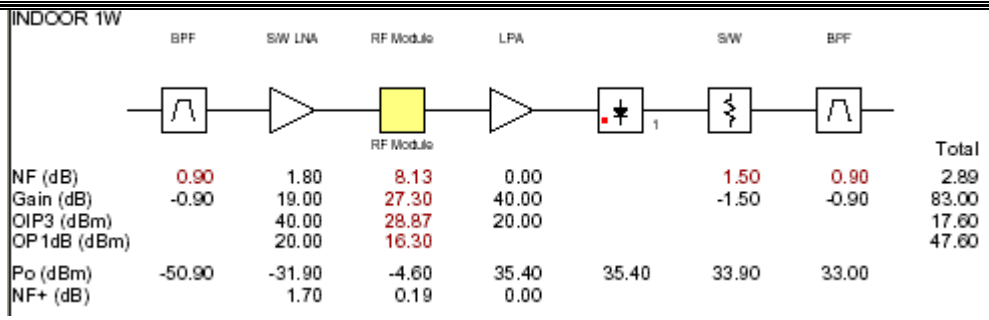
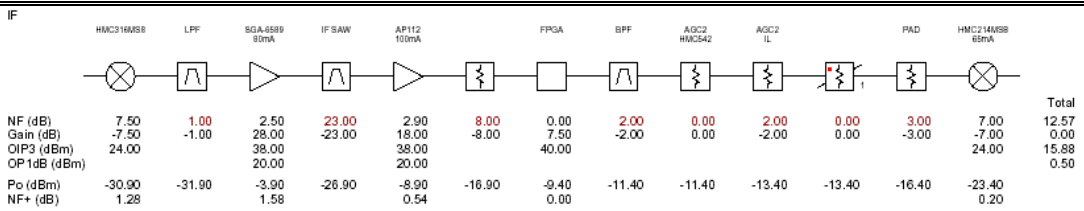
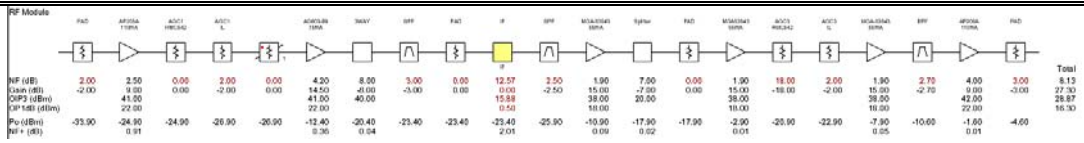
Up Link System



IF Path



RF Out



[Figure 20] UL Block

7 Additional Function

7.1 ASD (AUTO SHUTDOWN) Function

7.1.1 Aim of ASD Functions

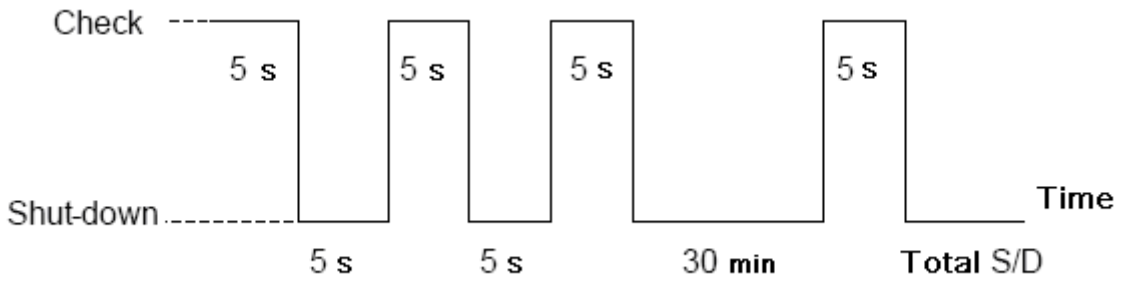
In order to protect the repeaters setup and networks stability, output must be suppressed. This is done by activating the automatic shutdown function when down link input is high, up link output is high or when oscillation occurs. Shutdown function operates by following the algorithms shown in the figure below.

7.1.2 ASD Management Procedure

For Automatic Shutdown, when DL Input is high, value is shown as -17dBm/Total and when UL Output is high, +33dBm/3FA is the value. ASD algorithm is performed like the figure below.

Section		Specification	Remark
Detection Level	Down Link Input	-17dBm/Total	
	Up Link Output	33dBm/Total	

[Table 17] ASD Function Operation Condition



[Figure 21] DL Over Input and UL Over Output Shutdown Algorithm

If the above oscillations recheck process confirms that there are no oscillations, then all records of previous steps are deleted and normal servicing is initiated. However, if oscillation is detected, oscillation check step starts from the beginning and recommences oscillation re-check process.

7.2 ALC Function

7.2.1 AIM of ALC FUNCTION

7.2.1.1 In order to protect DL's over input, ALC (Automatic Level Control) function is implemented. ALC's operational range input signal and DL's normal input range is -50dBm/FA ~ -20dBm/FA.

7.2.2 Management Procedure

7.2.2.1 ALC's maximum set point is -20dBm/Total and its minimum set point is -50dBm/Total. When a signal coming into the system is higher than ALC's set point, the repeater's ASD function is initiated.

Section	Specification	Remarks
ALC Set Level	-50dBm/Total~ -20dBm/Total	
ASD Operation Level	ALC Set Level +3dBm	

[Table 18] Function and Operation Level

PC Application Program

1 PC Application Program

The icons and folder names displayed in the manual can differ with that of the User's PC.

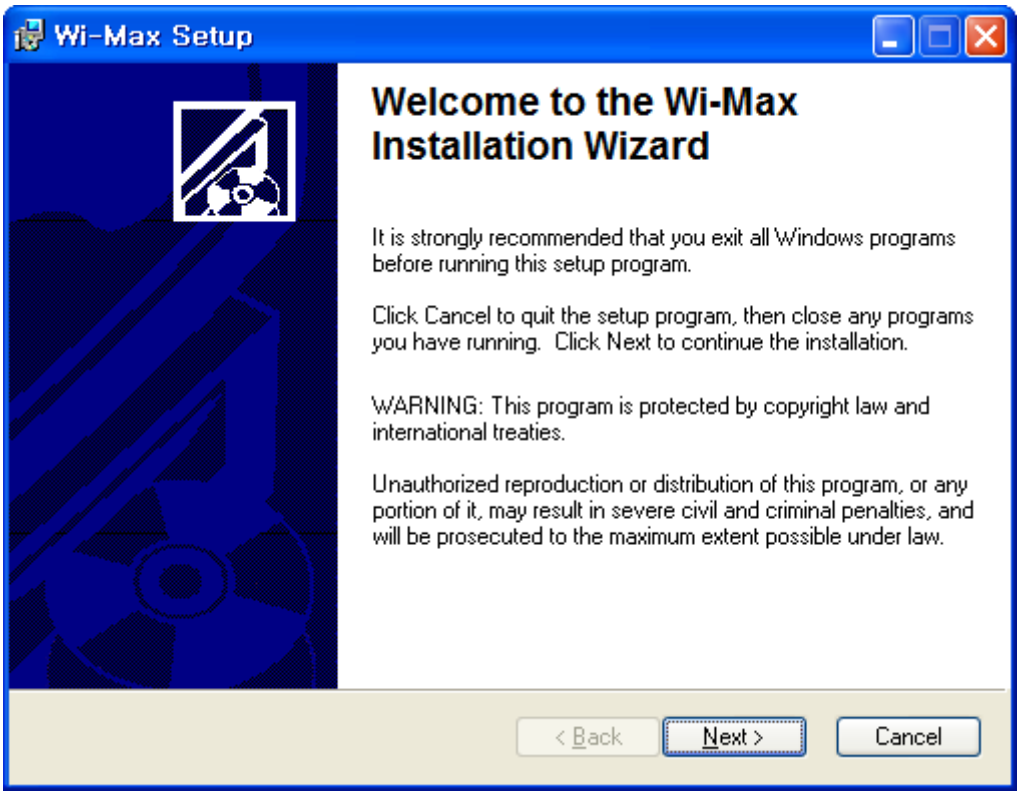
1.1 Program Installation

When accessing the installation program, the following files will be present.

<Figure 1-1>

Double click the Setup.exe file to begin installation.

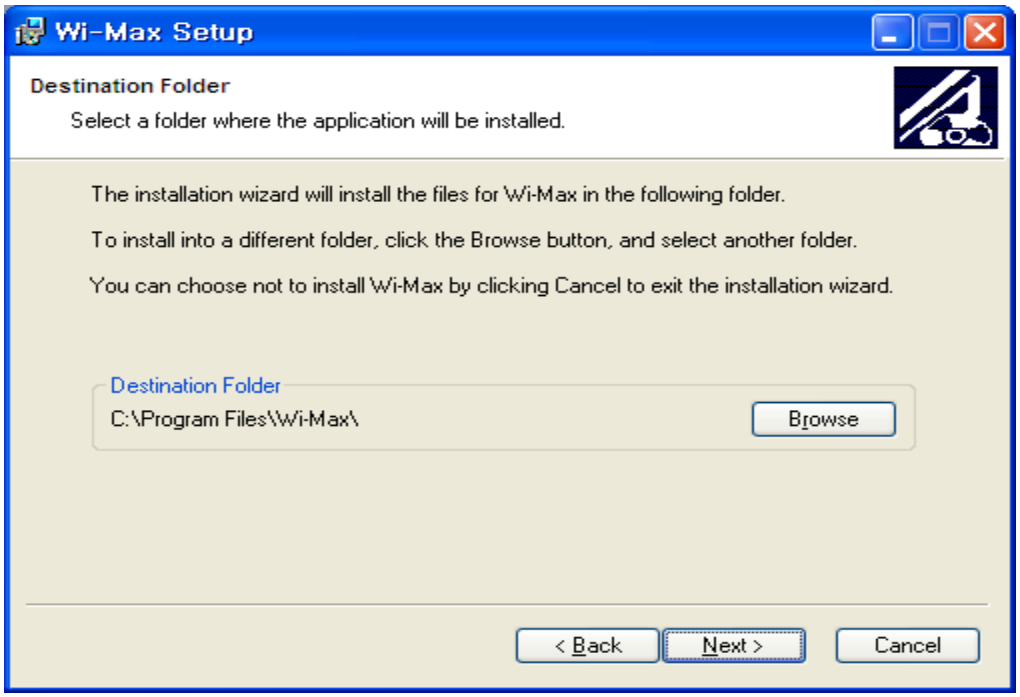
A window screen similar to one shown below will appear. The user is able to cancel and exit the installation process by clicking the [Cancel] button or continue with the installation by clicking the [Next] button.



<Figure 1-2> Install Start

The user must select the folder in which the program will be saved under.

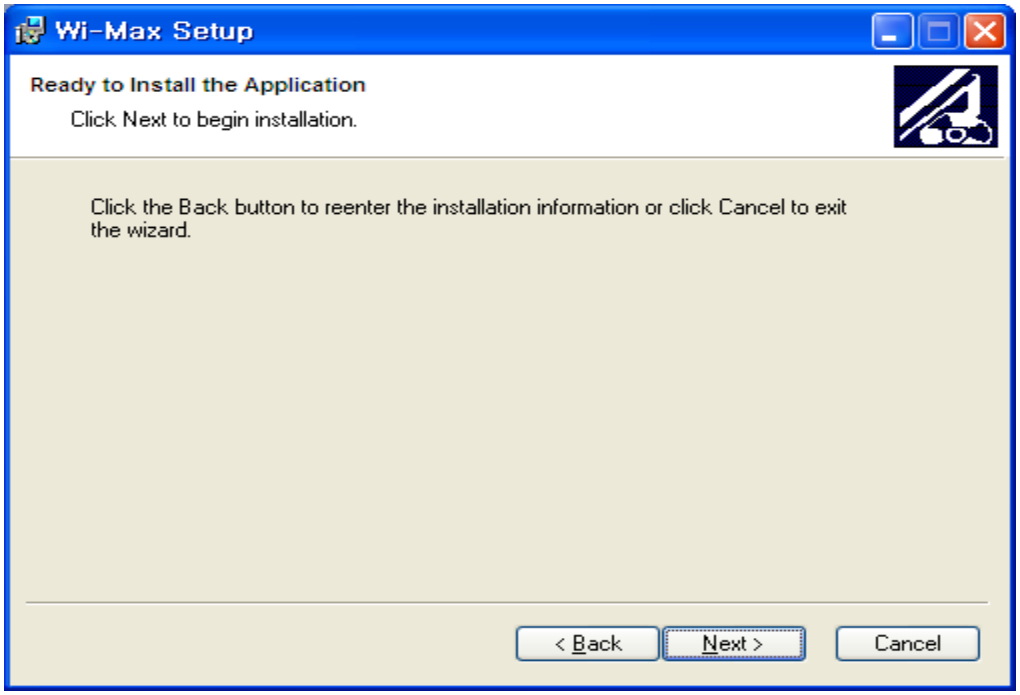
The standard folder in which the software is saved under is C:₩Program Files₩Wi-Max. However, if the user decides to customize the location of the program, it can be done by clicking the [Browse] button.



<Figure 1-3> Installation Folder Selection

Click the [Next] button once the destination has been selected.

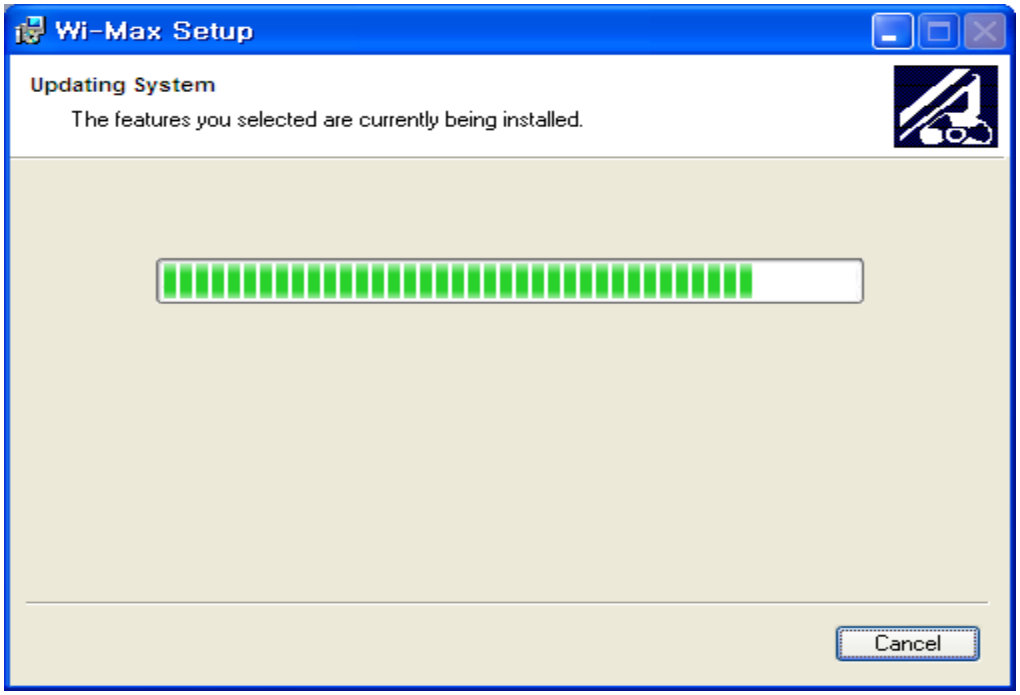
This will prompt a new window indicating installation process is ready.



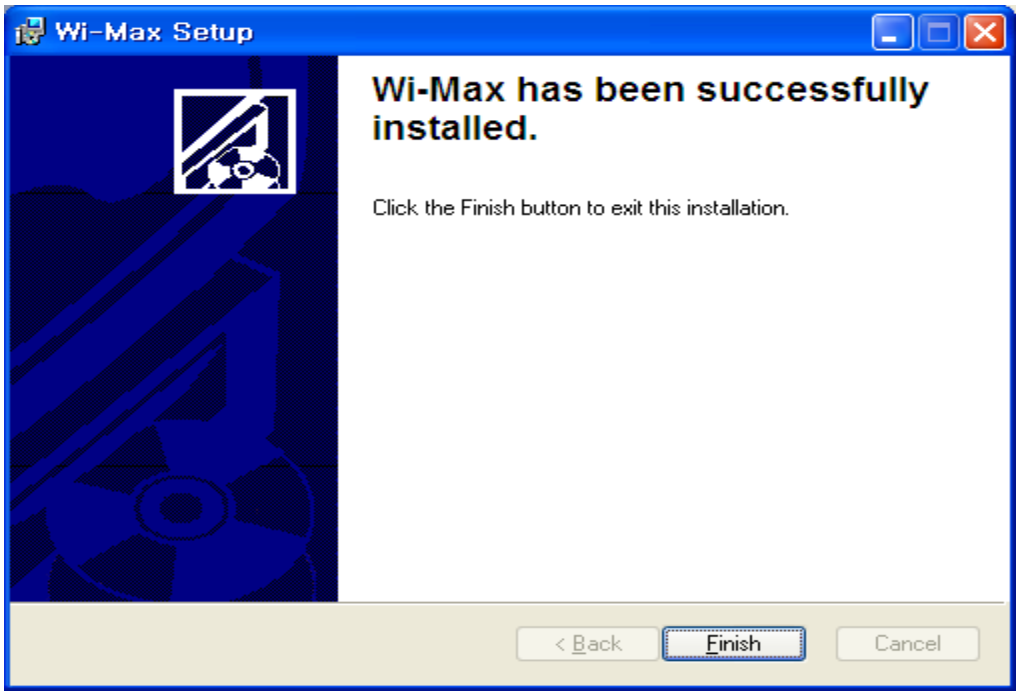
<Figure 1-4> Ready to Install Window

The [Back] button will allow the user to re-enter the section where he or she selects the destination of the software. If the user decides to continue with the installation process, this can be done by clicking the [Next] button. During the installation process, a window screen like the one shown in Figure 1-5 will automatically appear indicating the status of the installation.

Once the program has been completely installed, a window screen like the one shown in Figure 1-6 will automatically appear indicating the installation has been successfully completed.
The user can exit the Installation Wizard by clicking the [Finish] button.



<Figure1-5> Installation Status Window

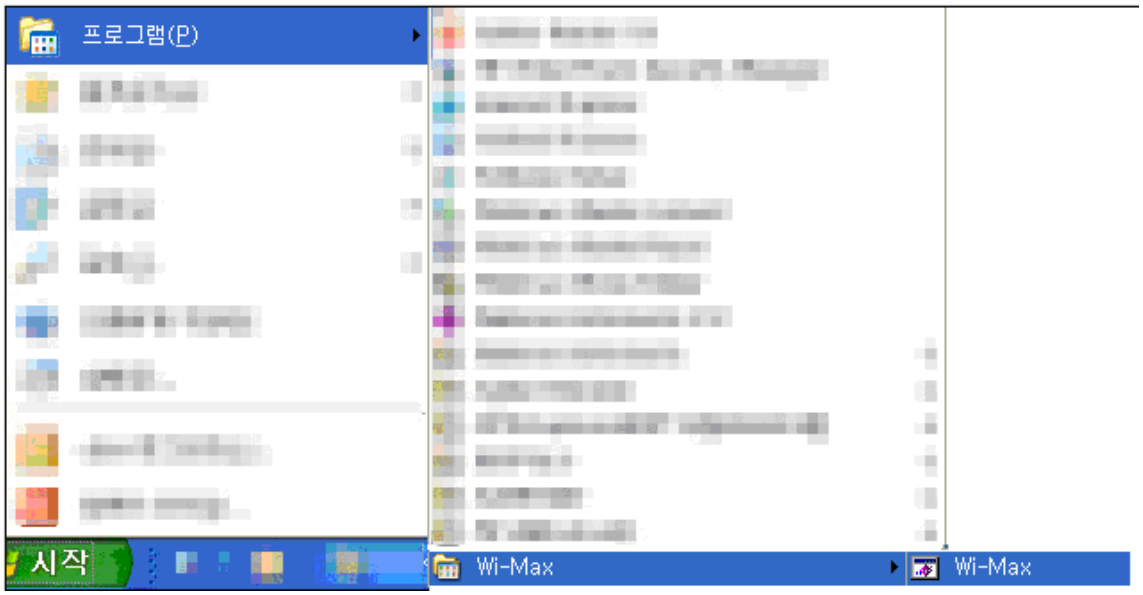


<Figure 1-6> Successful Installation Window

1.2 Program Start

Once the program has been successfully installed, the user may access the program by

clicking the [Start] ->Program->WiMAX button at the bottom right corner of the main window screen



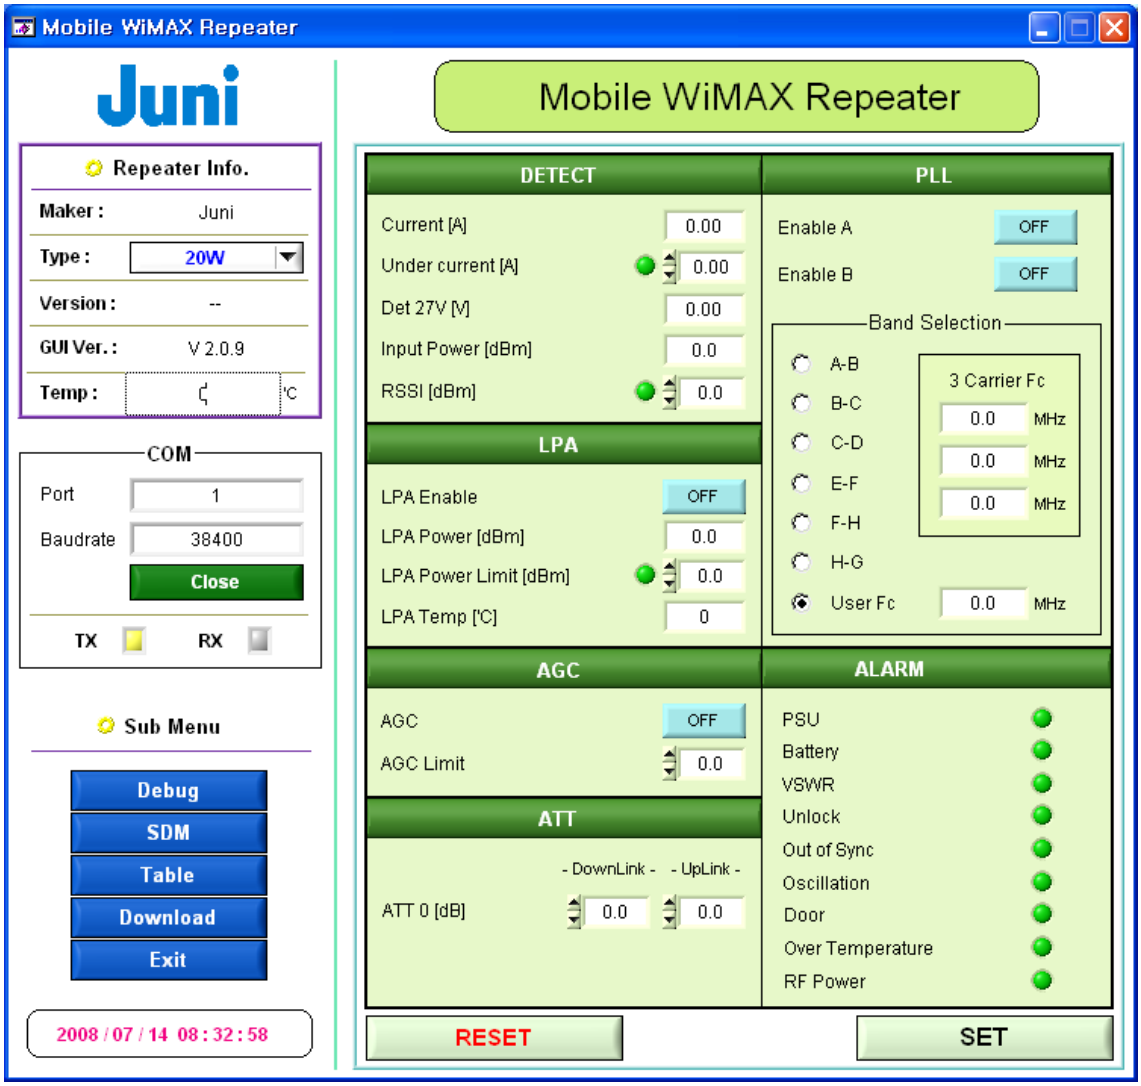
<Figure 2-1> Program Start

1.3 Status Monitoring and Control

Connect the serial port to the PC and open the software. The baud rate should be set at 38400bps. If the user wants to change the com port, it can be done by first pressing the [Port Close], then changing it to the desired port and then clicking the [Port Open] button. The connection can be verified by checking the TXD / RXD LED on the left of the screen. A blinking TXD / RXD LED indicate a successful connection.

1.3.1 Status Monitoring

The PC will automatically update the system values every 1 second.



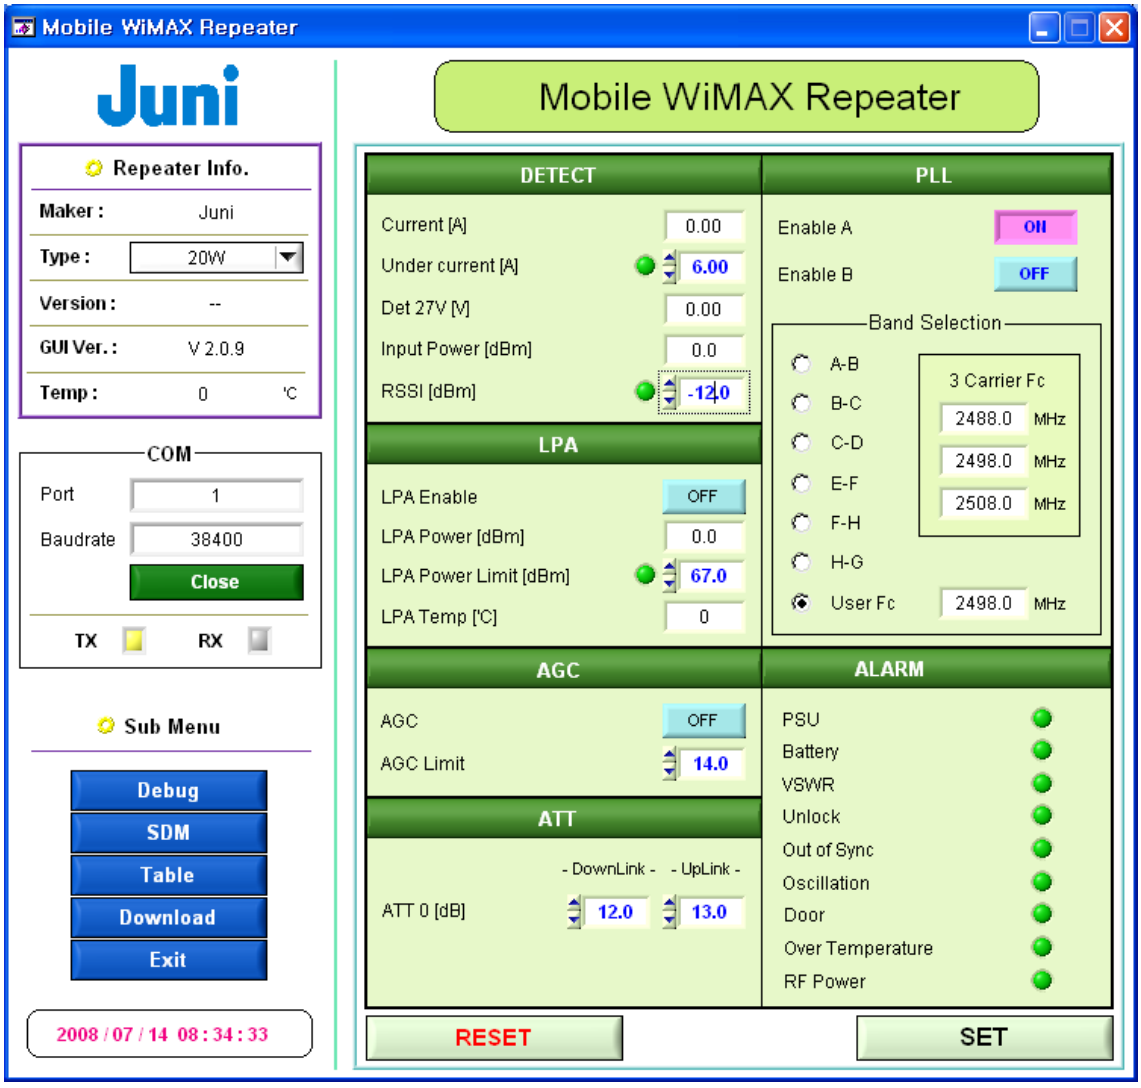
<Figure 3-1> Status Monitoring Window

The function of each button is explained below

Port Open / Close	Opening and closing current set port
Debug	Accessing the communication information Window
SDM	Accessing SDM Window
Table	Accessing the Table Window
Download	Accessing the Download Window
Exit	Exiting the Program
Reset	System Reboot
Set	Change settings

1.3.2 .Status Control and Setting

When changing the setting of the system through the software, the text of the changed items will change to a blue color. By pressing the [Set] button, all values that correspond to an item with blue text will be modified.



<Figure 3-2> Status Control and Setting Window

1.3.3 Status Monitoring and Control Items

The following table lists the various items of the repeater system that can be monitored and changed.

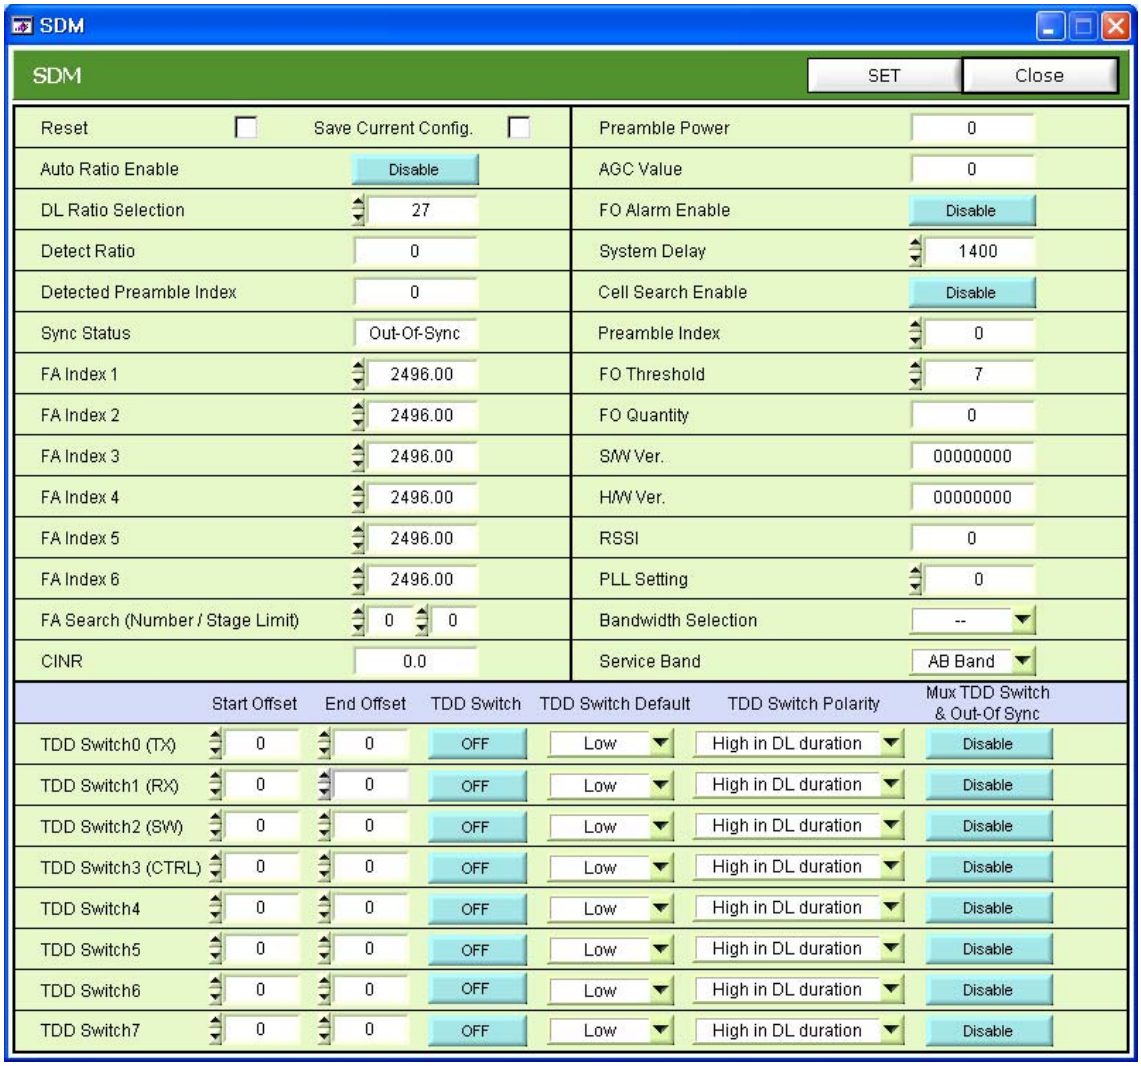
Item		Monitoring/Control	Notes
Repeater Info.	Maker	Monitoring	
	Type	Monitoring/Control	
	Version	Monitoring	
	Temp	Monitoring	[‘ C]
DETECT	Current	Monitoring	[A]
	Under Current	Monitoring/Control	[A]
	Det 27V	Monitoring	[V]
	Input Power	Monitoring	[dBm]
	RSSI	Monitoring/Control	Alarm: Red, Normal: Green [dBm]
LPA	LPA Enable	Monitoring/Control	ON / OFF
	LPA Power	Monitoring	[dBm]
	LPA Power Limit	Monitoring/Control	[dBm]
	LPA Temp	Monitoring	[‘ C]
PLL	Enable A	Monitoring/Control	ON / OFF
	Enable B	Monitoring/Control	ON / OFF
	Band Selection	Monitoring/Control	[MHz]
AGC	AGC ON/OFF	Monitoring/Control	ON / OFF
	AGC Limit	Monitoring/Control	
ATT	Down Link	Monitoring/Control	[dB]
	Up Link	Monitoring/Control	[dB]
ALARM	PSU	Monitoring	Alarm: Red, Normal: Green
	Battery	Monitoring	Alarm: Red, Normal: Green
	VSWR	Monitoring	Alarm: Red, Normal: Green

	Unlock	Monitoring	Alarm: Red, Normal: Green
	Out of Sync	Monitoring	Alarm: Red, Normal: Green
	Oscillation	Monitoring	Alarm: Red, Normal: Green
	Door	Monitoring	Alarm: Red, Normal: Green
	Ocer Temperature	Monitoring	Alarm: Red, Normal: Green
	RF Power	Monitoring	Alarm: Red, Normal: Green

1.3.4 SDM Status Monitoring

By clicking the [SDM] button on the Status/Control window, the user can access the SDM Data Monitoring window.

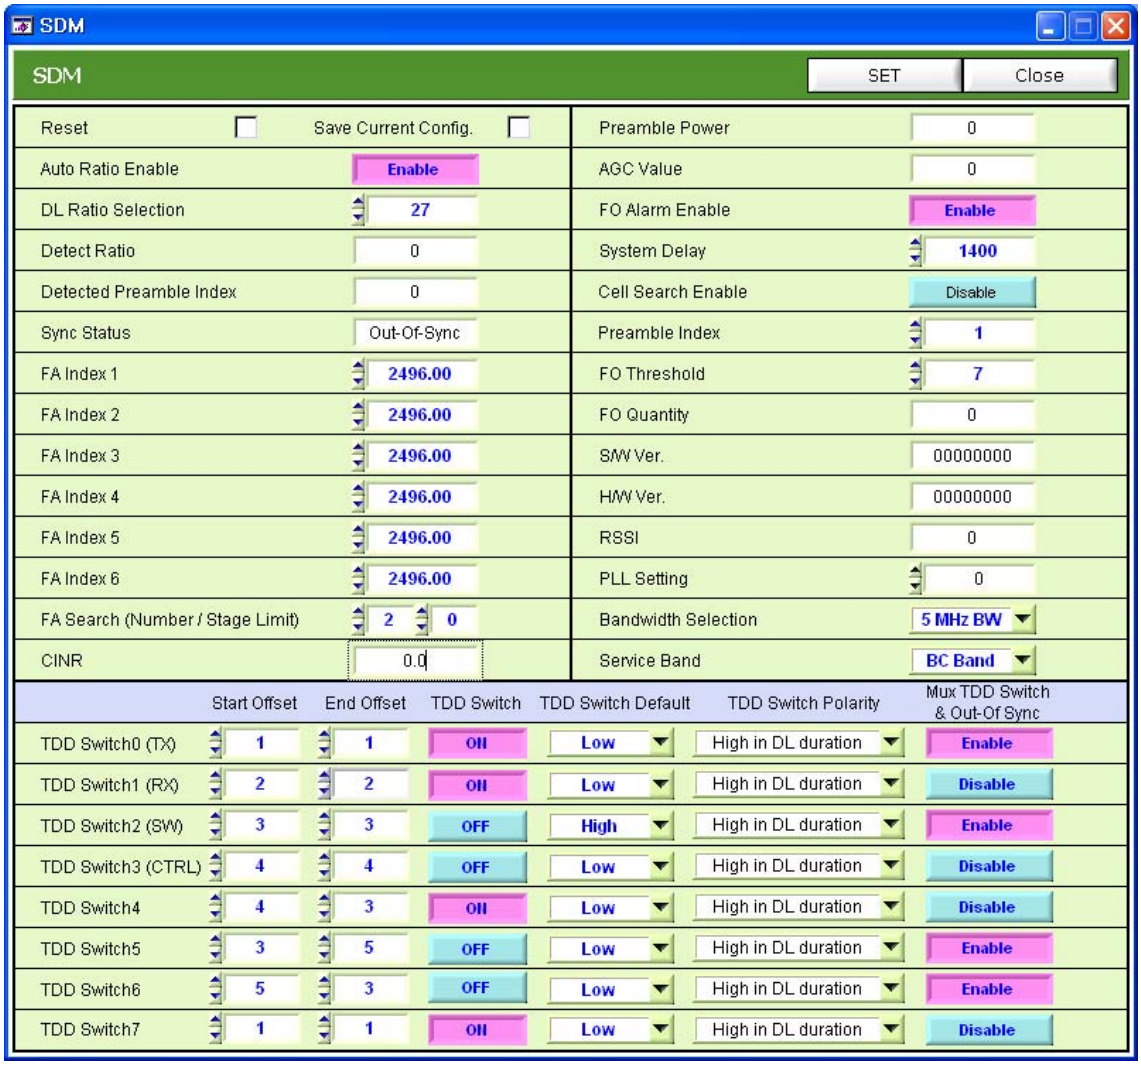
The PC will automatically update the system values every 1 second.



<Figure 3-3> SDM Status Monitoring and Control Window

1.3.5 SDM Control Settings

When changing the settings of the system through the software, the text of the changed it ems will change to a blue color. By pressing the [Set] button, all values that correspond t o an item with a blue text will be modified.



<Figure 3-4> SDM Status Control Window

1.3.6 SDM Status Monitoring and Control Items

The following table lists the various SDM status items that can be monitored and changed.

Item	Monitoring/Control	Notes
Reset	Monitoring/Control	
Auto Ratio Enable	Monitoring/Control	Enable / Disable
DL Ratio Selection	Monitoring/Control	
Detect Ratio	Monitoring	
Detected Preamble Index	Monitoring/Control	Enable / Disable
Sync Status	Monitoring

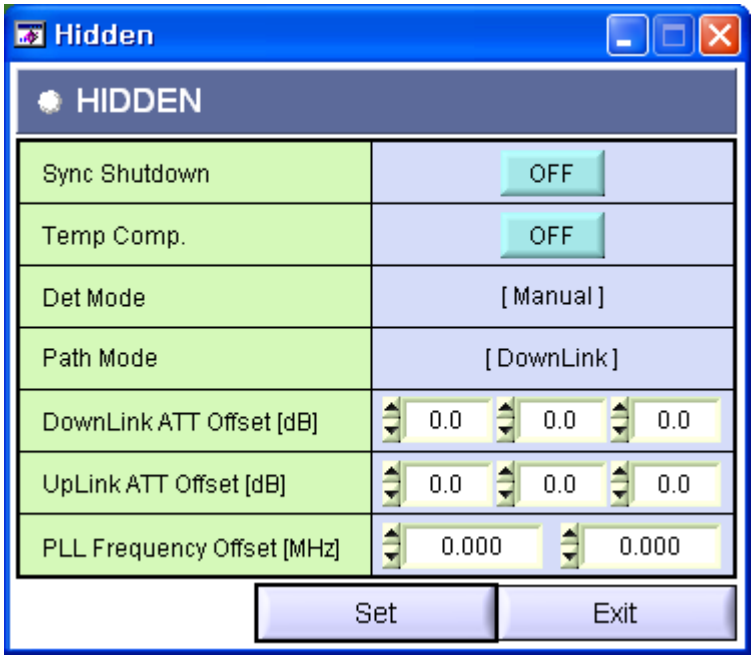
1.3.7 Hidden Status Control Settings

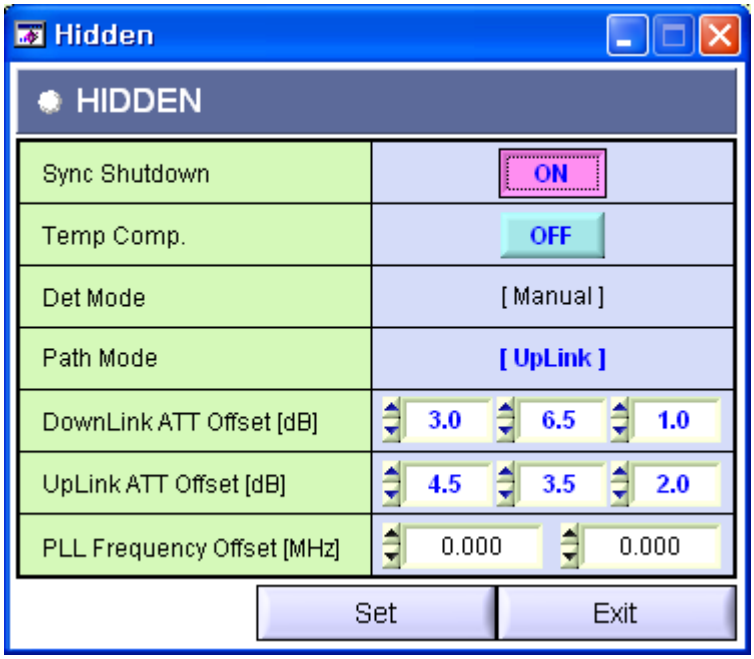
The user is able to access the Hidden Data Status Control and Settings section by pressing the [F8] key when he/she enters the Status Control and Settings window.
Automatic polling will occur every 1 sec between the system and the PC as the status values are displayed.



<Figure 3-5> Hidden Status Control Window

1.3.8 Hidden Status Setup

When changing the setting of the system through the software, the text of the changed ite ms will change to a blue color. By pressing the [Set] button, all values that correspond to an item with a blue text will be modified.



<Figure 3-6> Hidden Status Control Window

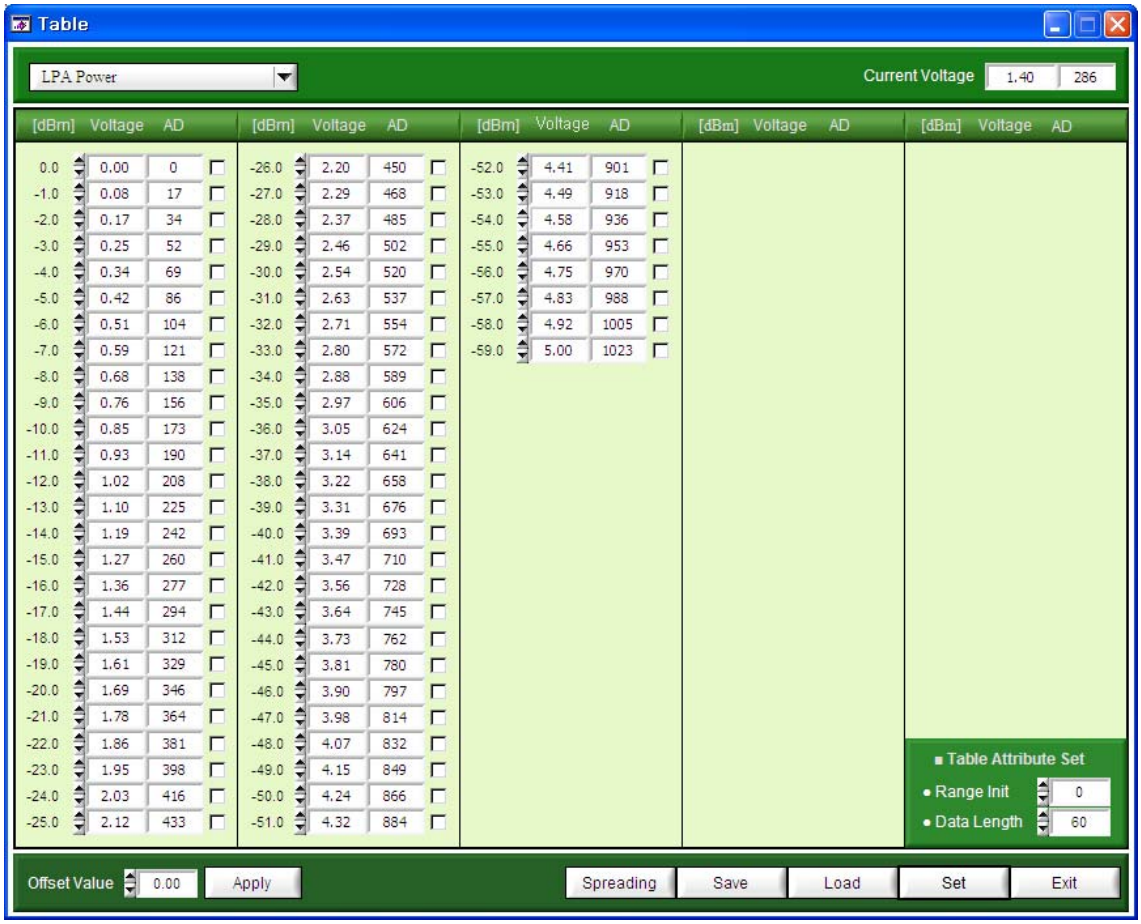
1.3.9 Hidden Status Monitoring/Control Items

The following table lists the various Hidden status items that can be monitored and changed.

Item	Monitoring/Control	Notes
Sync Shutdown	Monitoring/Control	ON / OFF
Temp Comp.	Monitoring/Control	ON / OFF
Det Mode	Monitoring/Control	Auto / Manual
Path Mode	Monitoring/Control	Down Link / Up Link
Down Link ATT Offset	Monitoring/Control	[dB]
	Monitoring/Control	[dB]
	Monitoring/Control	[dB]
Up Link ATT Offset	Monitoring/Control	[dB]
	Monitoring/Control	[dB]
	Monitoring/Control	[dB]

1.4 Table

By clicking the [Table] button on the Status Monitoring/Control window, the user is able to access the System Detect Table as shown below. The user is able to monitor and control these values.



<Figure 4-1> LPA Power Table

3.1.4.1 Table Selection

The user is able to access the table for the following items:

LPA Power

LPA Temp

Input Detect

Current Monitor

Det 27V Monitor

ATTN 0

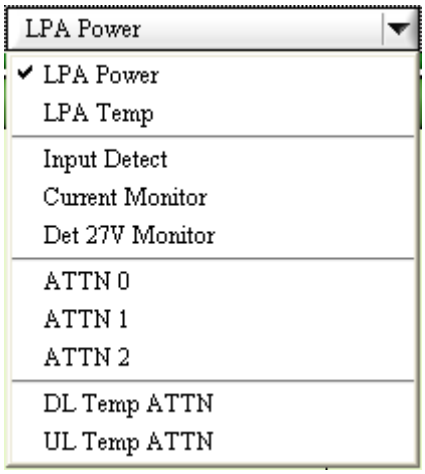
ATTN 1

ATTN 2

DL Temp ATTN

UL Temp ATTN

The user is able to access the table of the different items by using the combination box and selecting the desired item.



<Figure 4-2> Table Selection

1.4.1 Table Value Input

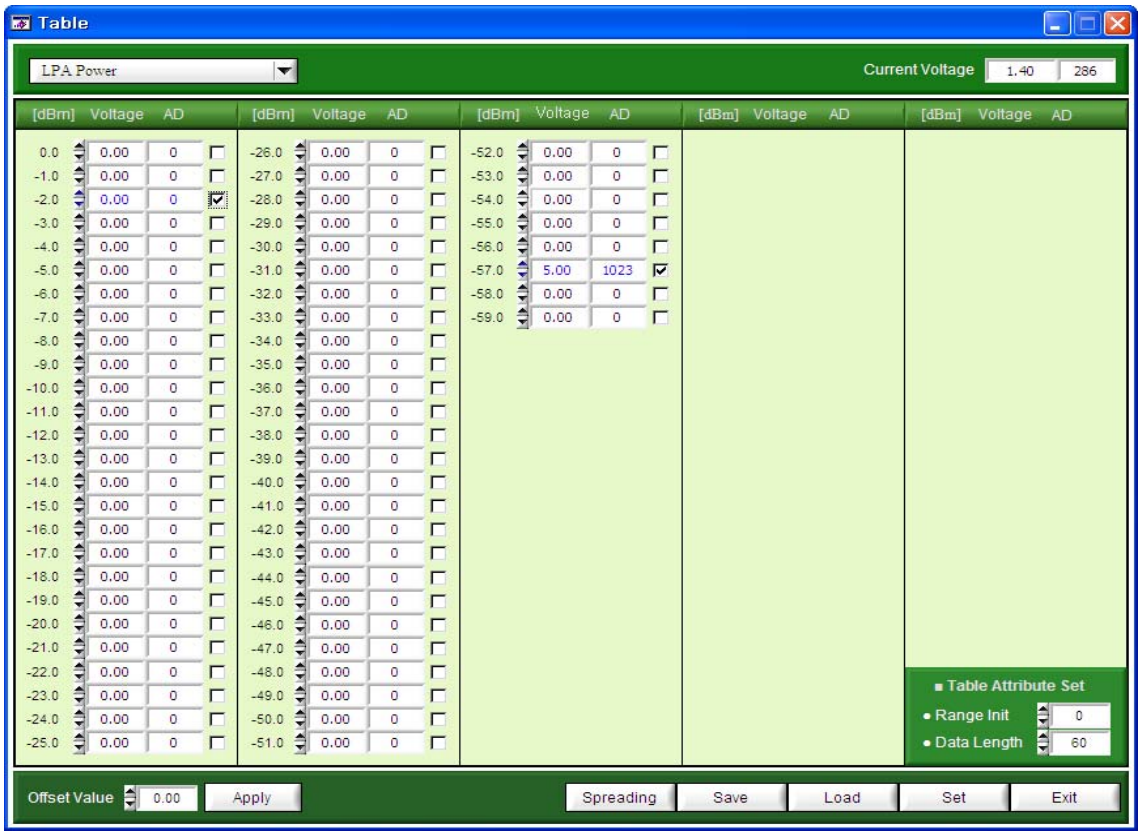
The user is able to change the data value by using the cursor provided or by registering a new value.

<Figure 4-3> Table Value Input

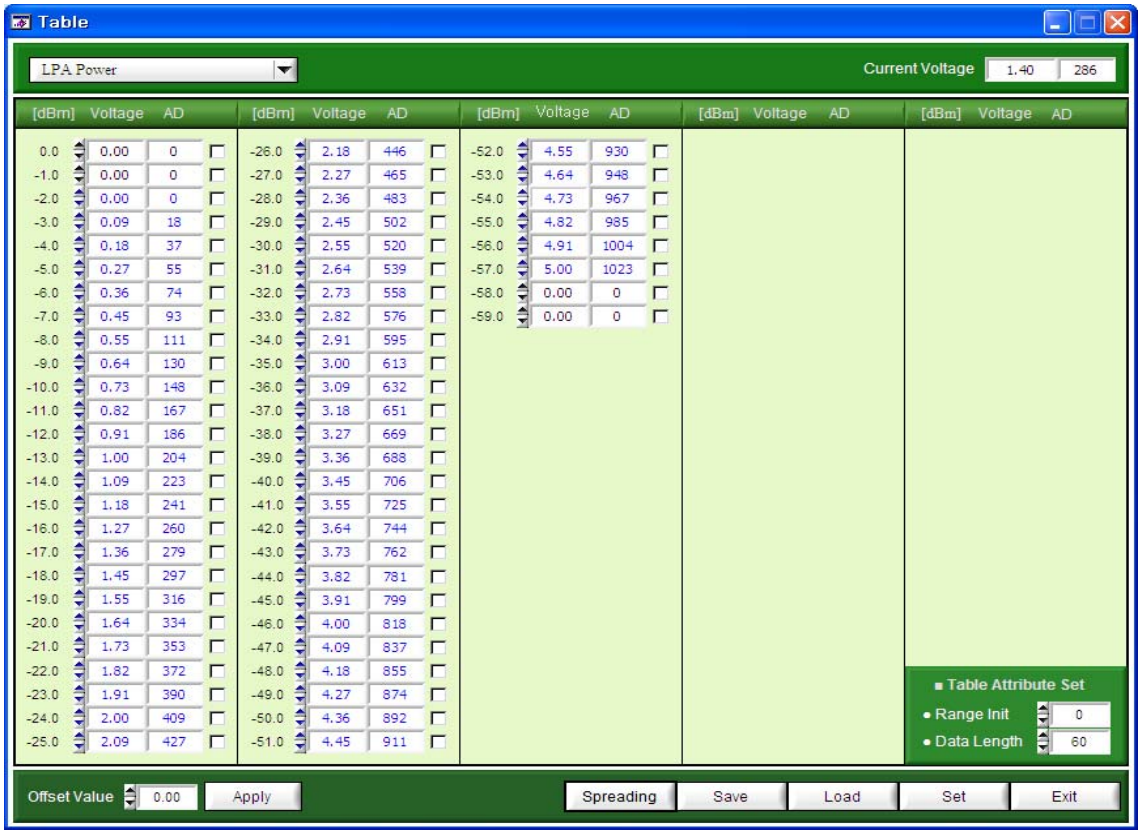
When the voltage value is changed by the user as shown above, the AD value will automatically change accordingly.

The user may change several values within a range simultaneously by using the [Spreading] function. As shown in the figures below, first check the box with the

beginning and end range values. Once this has been done, press the [Spreading] button. This will automatically set values for all within that range as shown in figure 4-5



<Figure 4-4> First Phase of Spreading

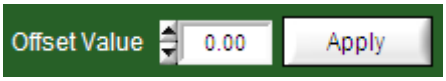


<Figure 4-5> Spreading Result

When entering the Detect Table, the current voltage reading is displayed on the left corner . This value can be automatically applied to the value boxes by right clicking the box wher e the user is able to change the values.

<Figure 4-6> Current Voltage Reading

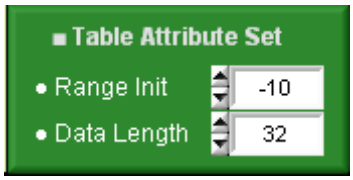
The Offset value located at the bottom left corner can be adjusted by the user. NOTE* The Offset Value will apply to all values in the table.



<Figure 4-7> Table Offset

1.4.2 Table Attribute Setting

The Offset Value located at the bottom left corner can be adjusted by the user. NOTE* The Offset Value will apply to all values in the table.



<Figure 4-8> Table Attribute

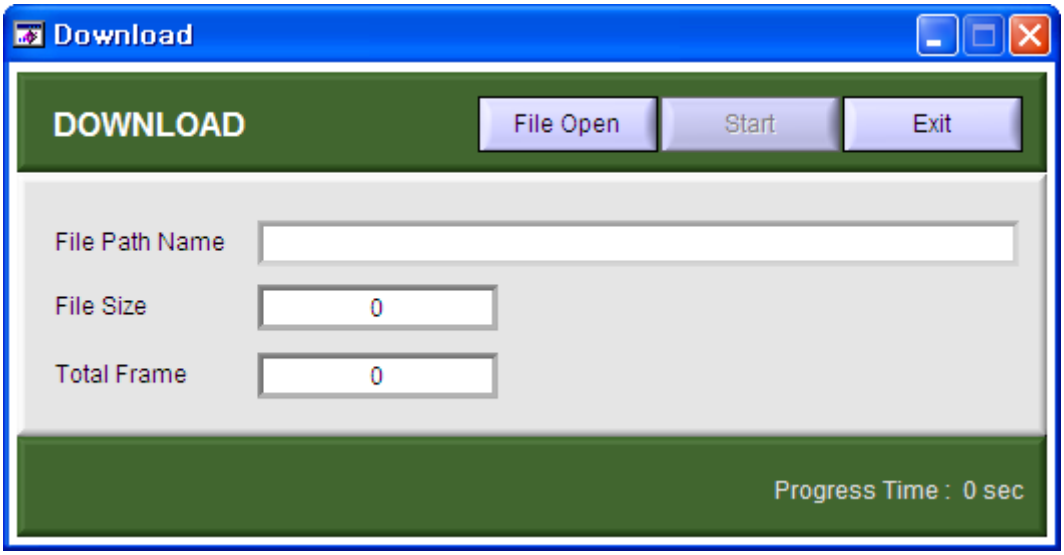
Explanations of other function buttons are listed below.

Save	Saving the currently updated values into the PC.
Load	Loading an already saved set range of values.
Set	To apply the changes made by the user.
Exit	Exiting the table

1.5 DOWNLOAD

1.5.1 Download Preparation

By clicking the Download button on the Status/Monitoring screen, the user is able to F/W Download files into the system. By clicking the Download button the user will be directed to a download window as seen below.



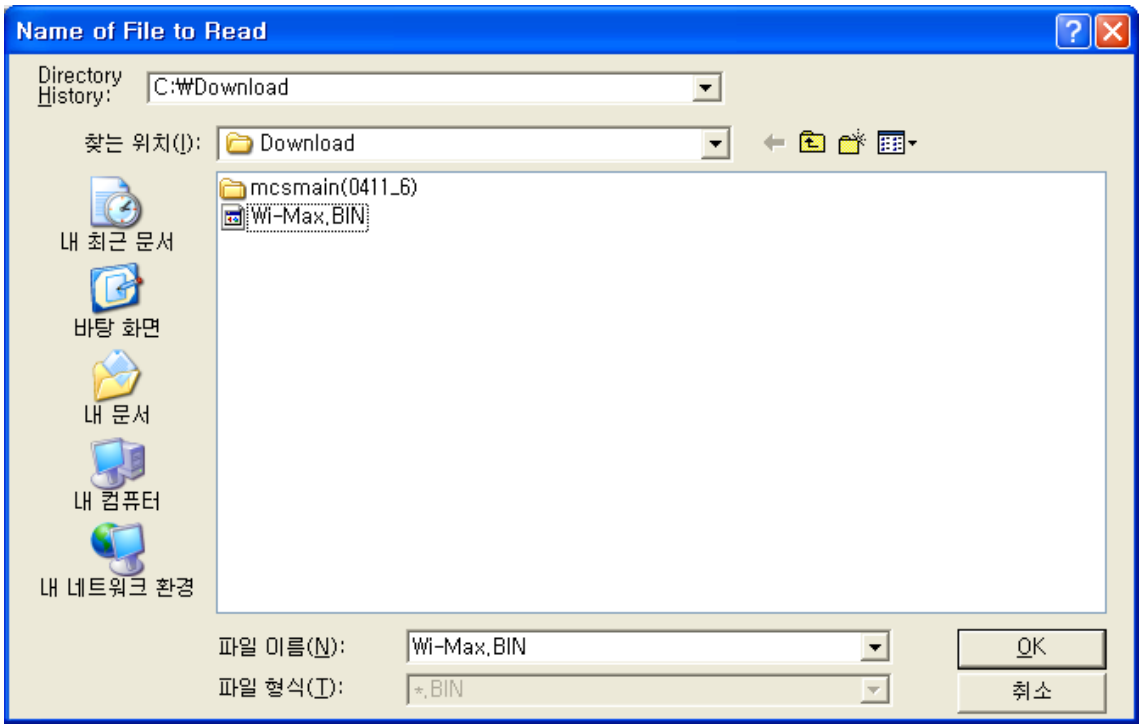
<Figure 5-1> Download Ready Window

Here, [File Open] button is clicked.

If user wants to exit, click the [Exit] button.

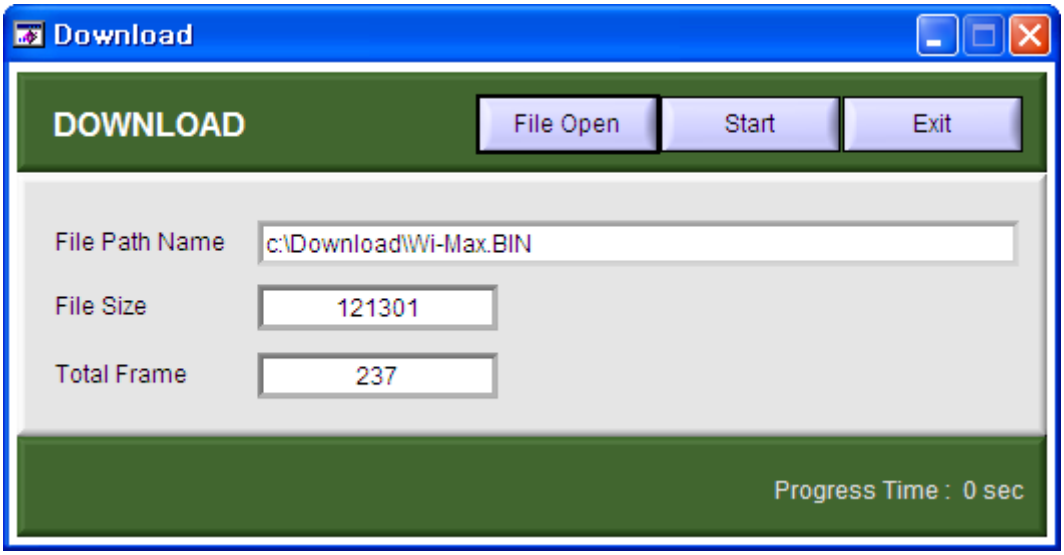
1.5.2 File Open

Click the [File Open] button to access the file search window shown below.



<Figure 5-2> File Open

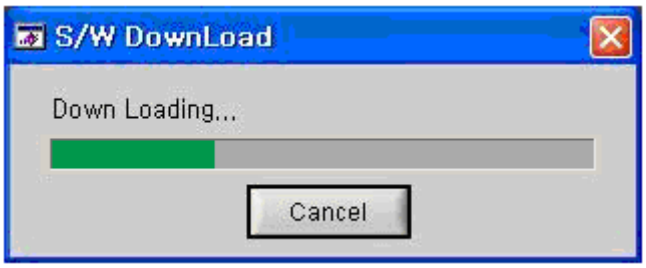
The user has the option of typing the exact file name in the entry box or clicking and selecting the " .bin" file from the main screen. Once the user selects the file and clicks the [OK] button, the window will indicate the file name; file size and total frame of the selected file.



<Figure 5-3> Preparation for Download

1.5.3 Download Start

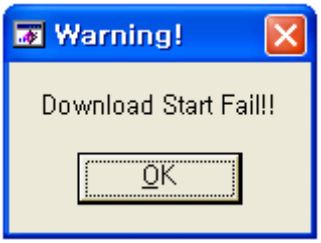
Once the user presses the [Start] button as shown in the figure <Figure 5-3> above, the download process will begin. This will be followed by a progress bar indicating the status of download as shown below.



<Figure 5-4> Download Progress Window

If the user presses the [Cancel] button, the download will immediately terminate.

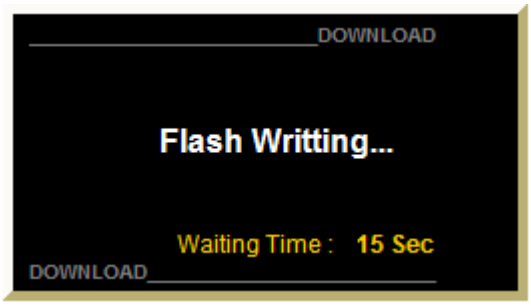
If the download process is not successfully completed, a window notifying a failure will appear.



<Figure 5-5> Window Notifying a Failed Download Attempt

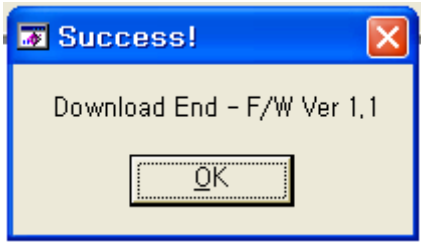
1.5.4 Download Complete

Once download the is complete, a flashing screen will appear during the initialization period. Completion is notified to the user by a window indicating that download has been completed.



[Figure 5-6] Flash Write

Once all downloading has been completed, a small confirmation will pop up as shown bel ow.



[Figure 5-7] Download Complete

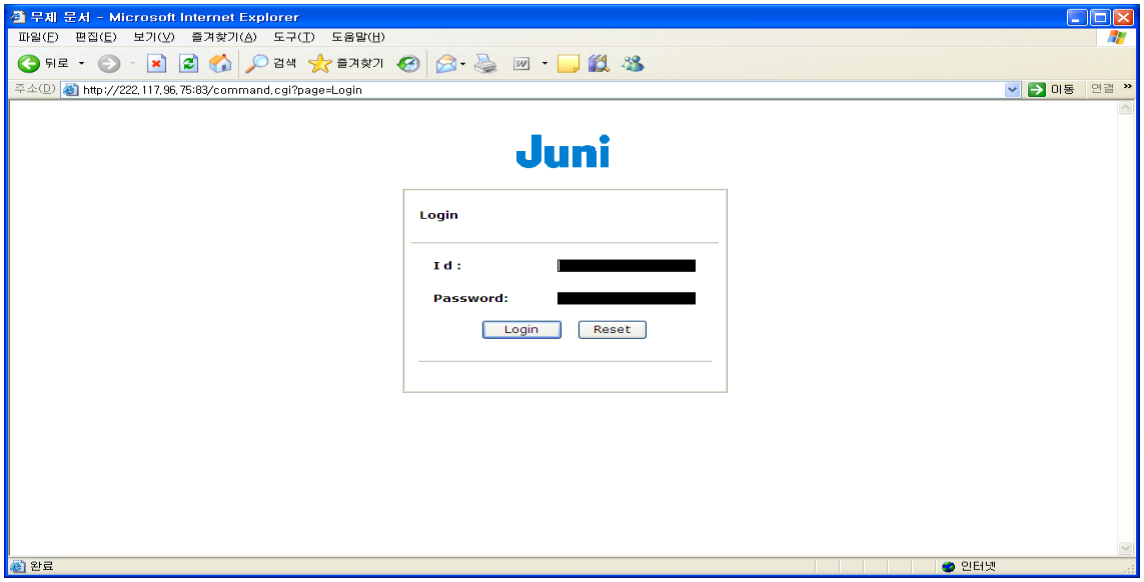
2 WEB GUI

2.1 Program Start

2.1.1 Web Site Link

Open an Internet Explorer window or an available web browser. Enter an appropriate IP and port address in the URL column.

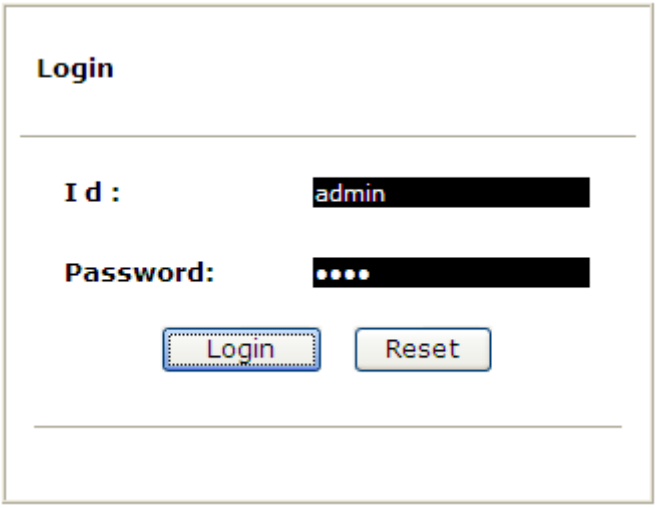
If the correct link has been entered, a Login display like the one below will be shown.



<Figure 10-1> Initial Login Page

2.1.2 Login

After a specified User ID and relevant account password has been entered, click on the [Login] button.

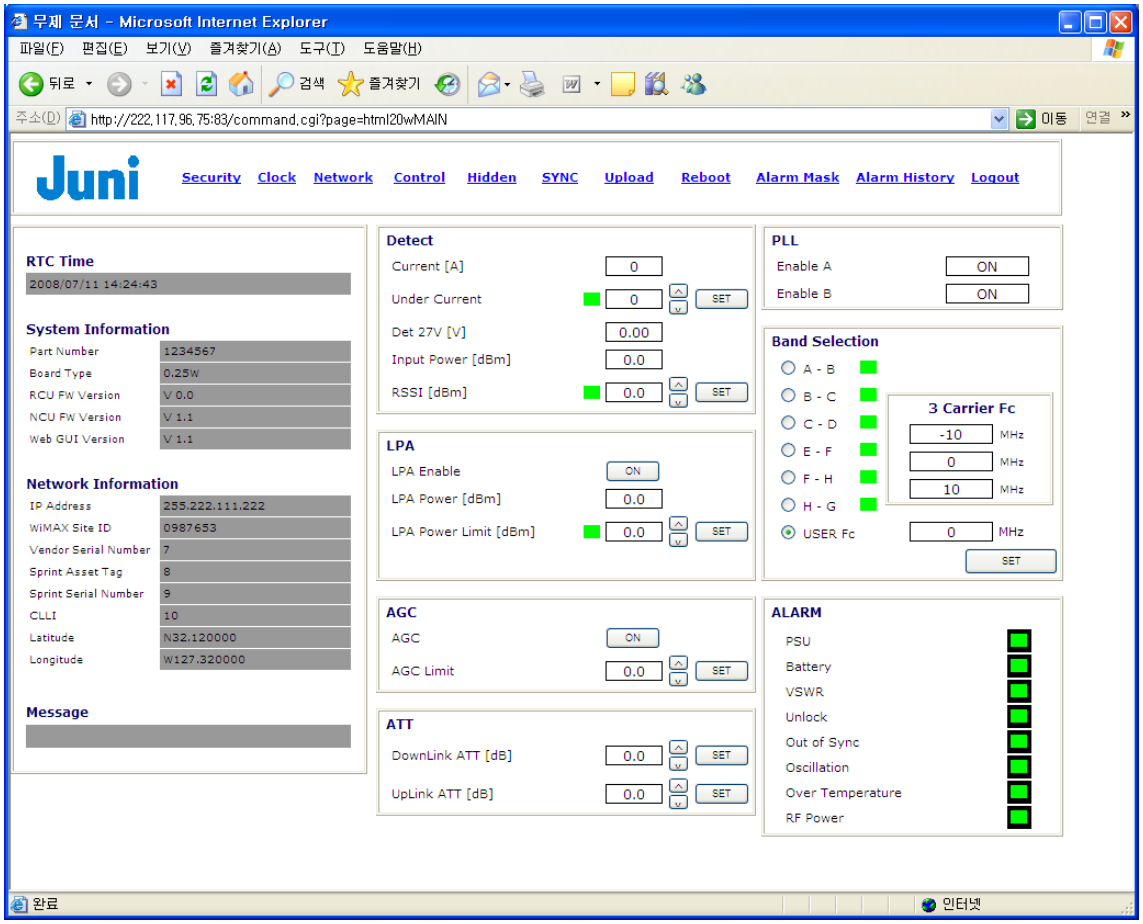


<Figure 10-2> Login

2.2 Basic Display Configuration

2.2.1 Initial Display

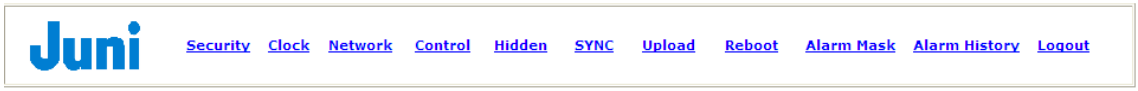
After Login has been successful, a display like the one below is shown. Initial display will be a ‘ Control’ display.



<Figure 10-3> Initial Display

2.2.2 Menu

Near the top of the web page, there are some menu items. When clicked, it will display the relevant function web page.



<Figure 10-4> Menu

Below are the menu functions and explanations:

- Security : Account Password Change.
- Clock : System Clock change.
- Network : Network and miscellaneous information setting.
- Control : System status monitoring and control.
- Hidden : System hidden items status monitoring and control.
- SYNC : SYNC system status monitoring and control.
- Upload : Repeater firmware Update.
- Reboot : System Reboot.
- Alarm History : Monitoring occurrence of alarm at present conditions.
- Alarm Mask : Alarm mask status monitoring and control.
- Logout : Logout for current user and returning to login display page.

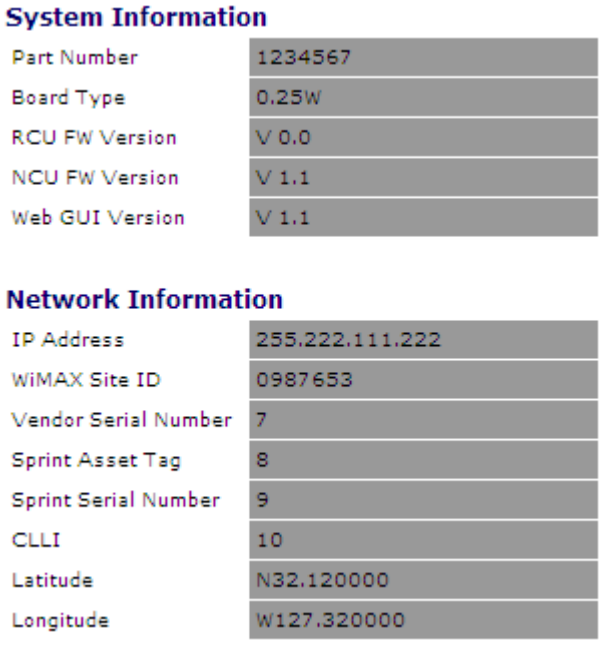
2.2.3 Date/Time Information

On the top left section of the web page, below the main menu items, the system's set clock is displayed.

<Figure 10-5> Date/Time Information

2.2.4 Network/System Information

Below the Date/Time Information section, System and Network Information are displayed.

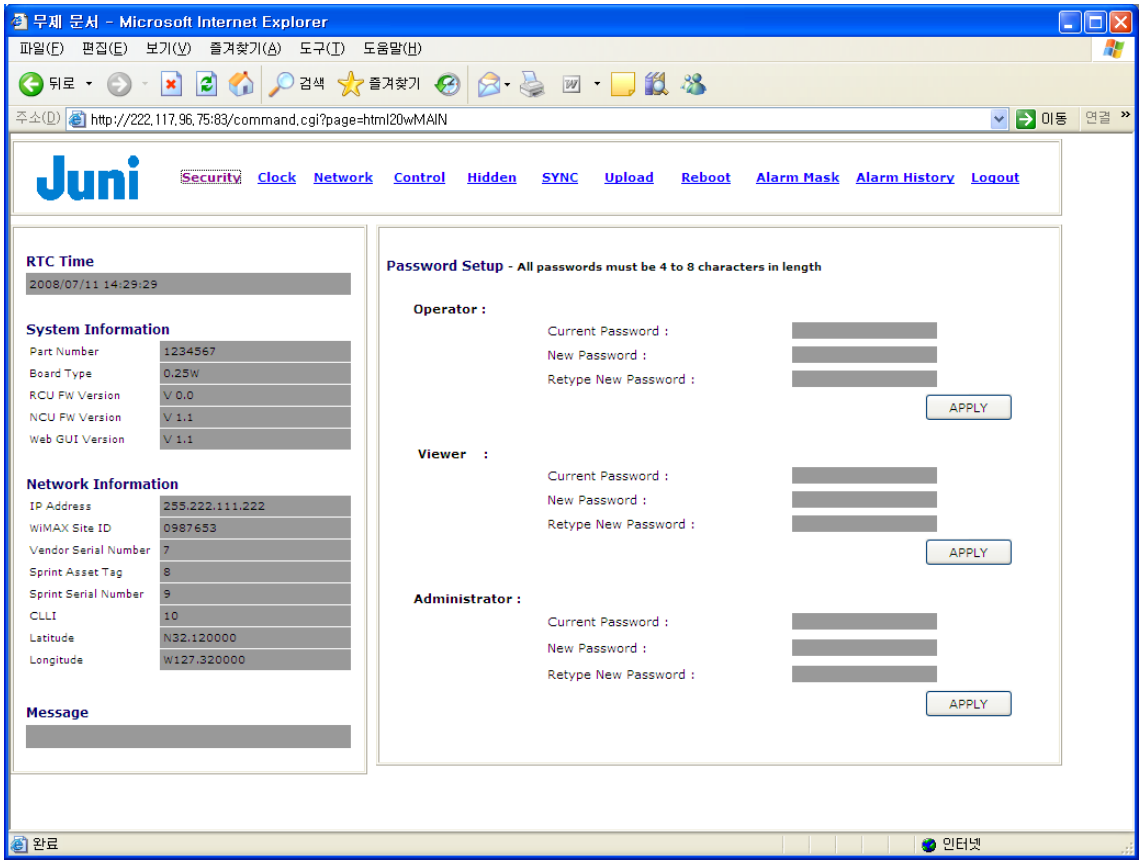


<Figure 10-6> Network/System Information

2.3 Security (Password Setup)

Security is used for changing a user's Password. All Passwords must be set with 4~8 characters.

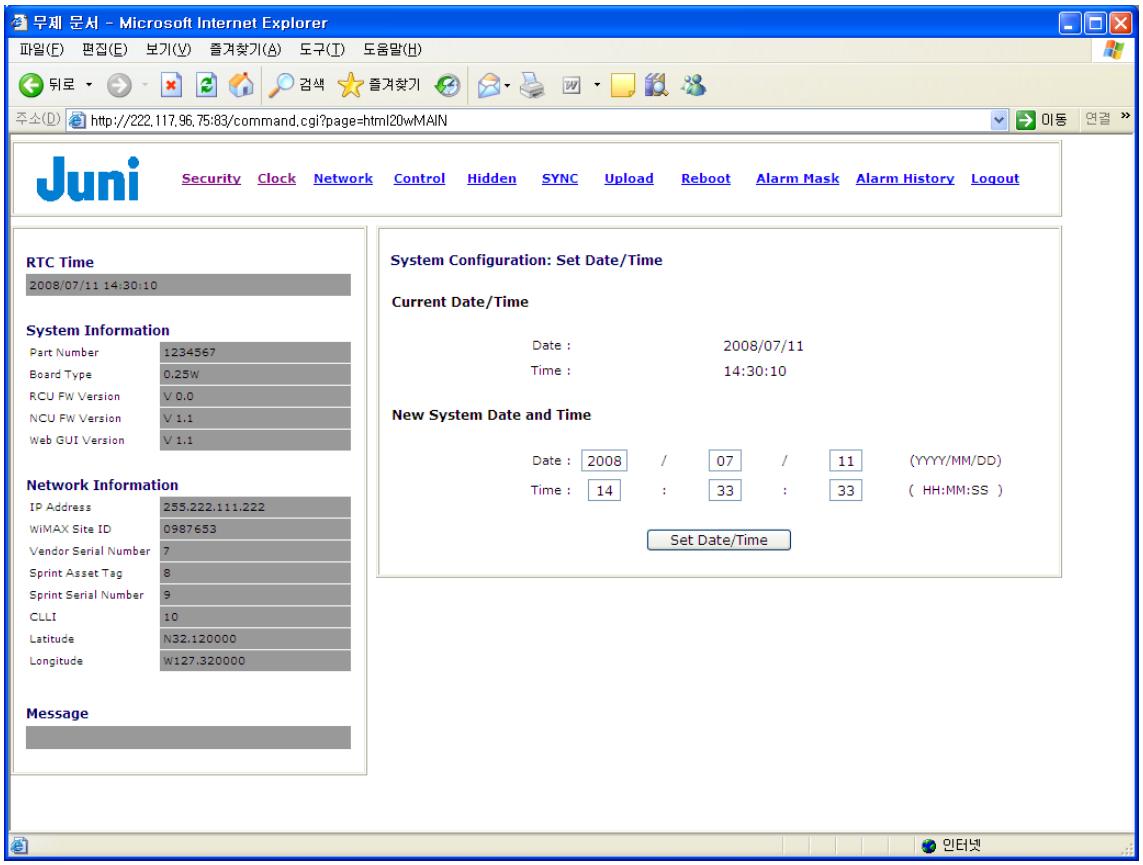
When changing a user's Password, the user account must be selected. Also, once Current Password, New Password and Retyping of the New Password has been inserted, [APPLY] button is clicked.



<Figure 10-7> Security (Password Setup)

2.4 Clock

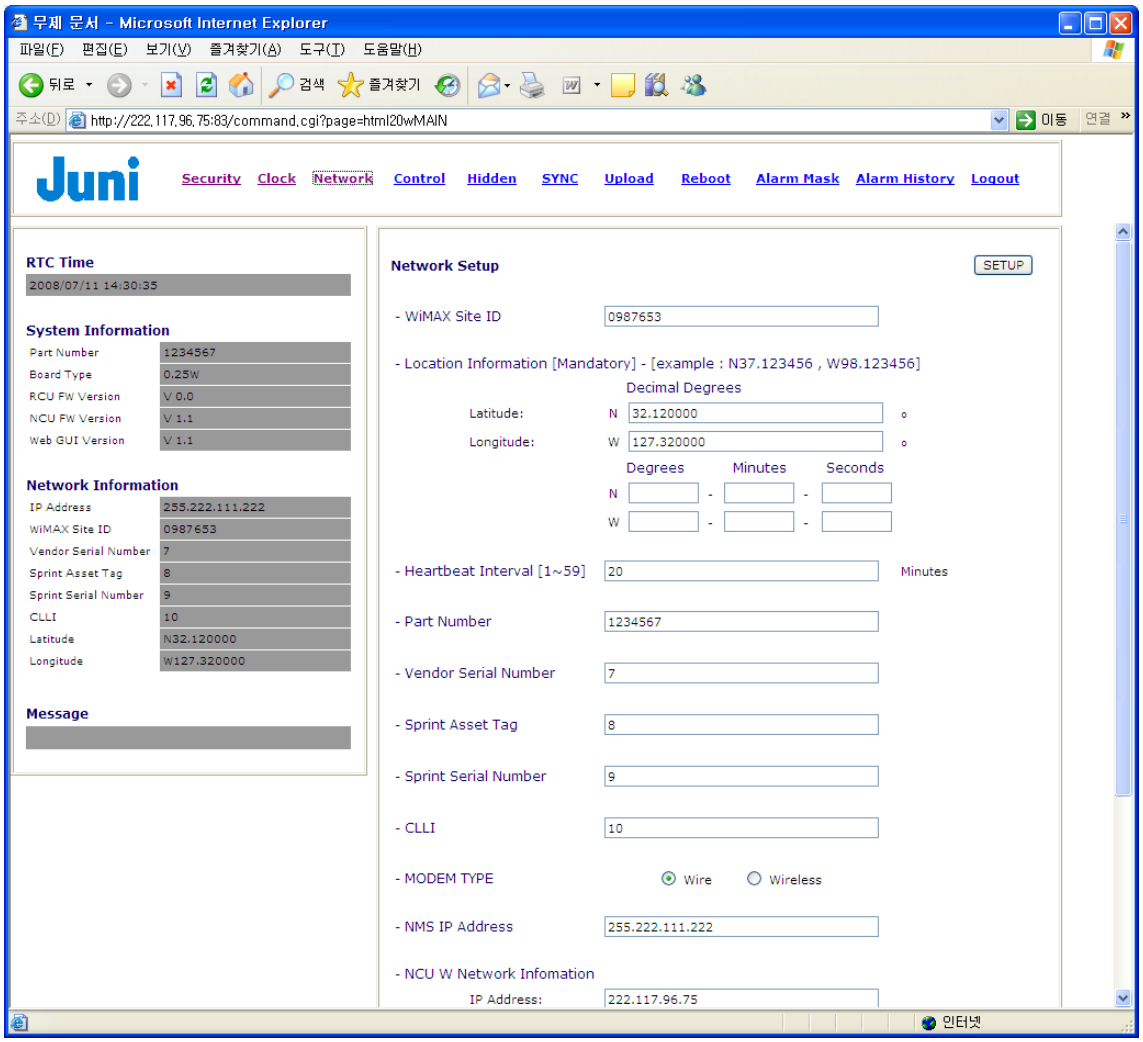
Clock menu displays and sets system's time. The changed clock values can be viewed on the 'RTC Time' section located below 'Juni' logo left of the page. When changing Date/Time, the desired inputs are added and [Set Date/Time] button is clicked.



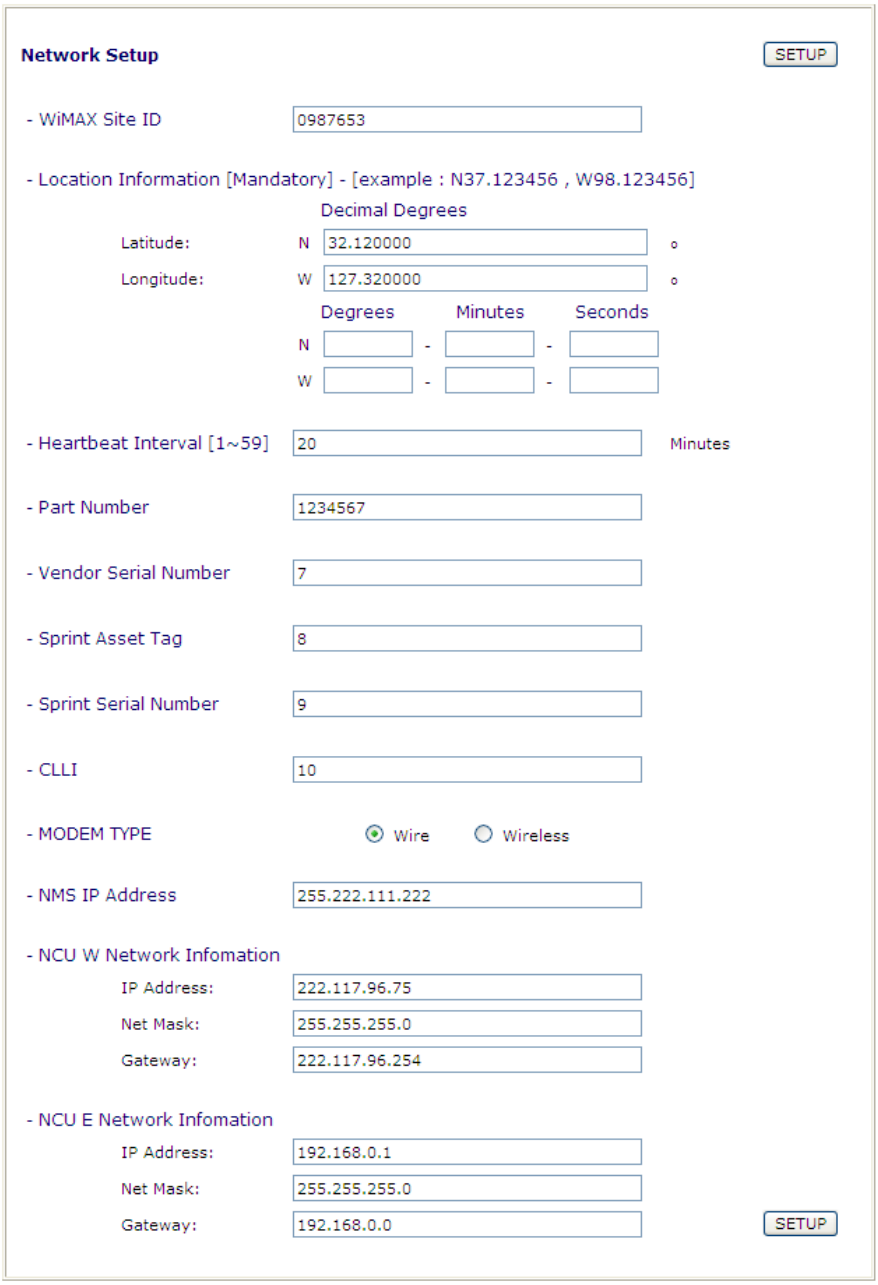
<Figure 10-8> Clock

2.5 Network

Network menu monitors and controls network information. When there are items in the network setup that needs to be changed, information is added and changed in the ‘Network Setup’ section. After all relevant information has been added, [SETUP] button which is located at the top and bottom of the page, is clicked.



<Figure 10-9> Network



<Figure 10-10> Network Setup

Following shows items that can be monitored or controlled in the Network Setup page:

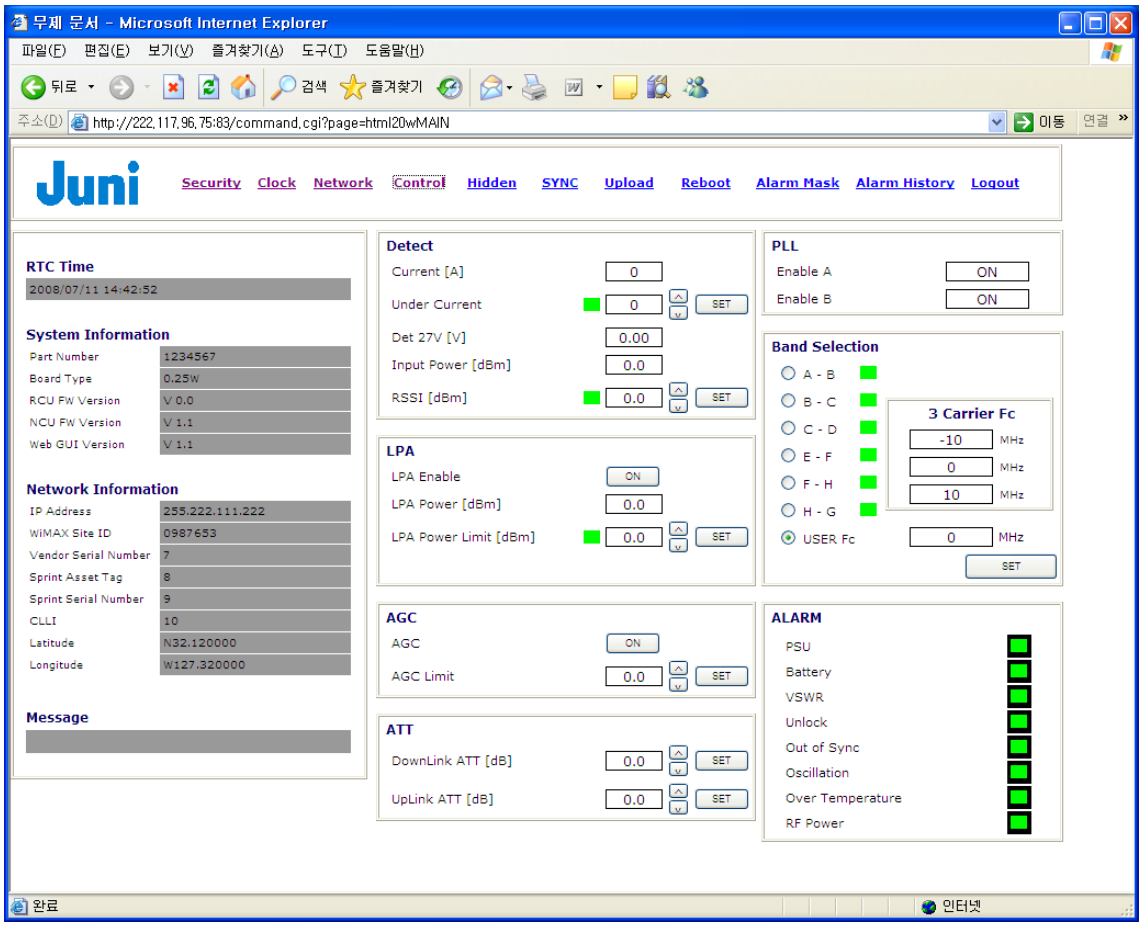
Item		Notes
Cascade Code		
Location Information	Latitude	
	Longitude	
Heartbeat Interval		[minutes]
Part Number		
Vendor Serial Number		
Sprint Asset Tag		
Sprint Serial Number		
CLLI		
MODEM TYPE		
NMS IP Address		
NCU W Network Information	IP Address	
	Net Mask	
	Gate Way	
NCU E Network Information	IP Address	
	Net Mask	
	Gate Way	

2.6 Control

System status can be monitored or controlled in the ‘ Control’ menu. Roughly for every 15 seconds, data is sent, received and updated on this page.

When a user wants to control or change a setting, the moment a control item is clicked or a value is changed, communication with the repeater is momentarily halted. The repeater would then wait for a control command.

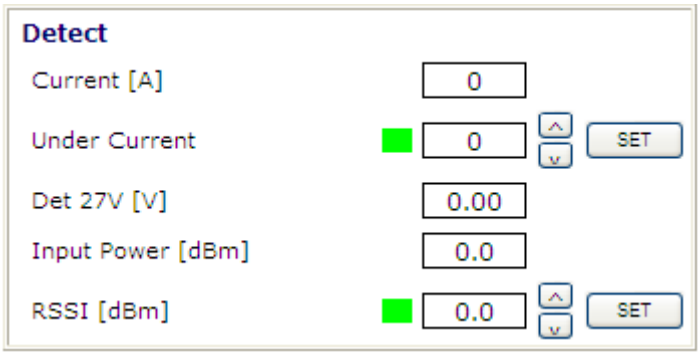
When values have been added or changed within the item’s appropriate range, [Set] button is clicked. This will forward a control command to the repeater. In situations where [SET] button is not clicked, after 10 seconds, system recommences communication.



<Figure 10-11> Control

2.6.1 Detect

Monitoring and Control for Detect Status.



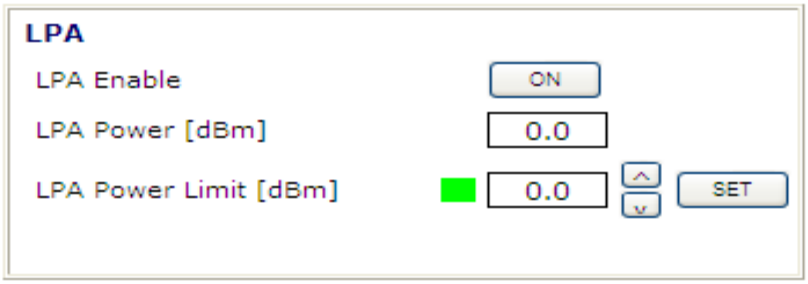
<Figure 10-12> Detect

Below are items that are included in the Detect section for monitoring and control.

Item	Unit	Notes
Current	[A]	Monitoring
Under Current	[A] [Green: Normal, Red: Alarm]	Monitoring/Control Monitoring
Det 27V	[V]	Monitoring
Input Power	[dBm]	Monitoring
RSSI	[dBm] [Green: Normal, Red: Alarm]	Monitoring/Control Monitoring

2.6.2 LPA

Monitoring and Control for LPA Status.



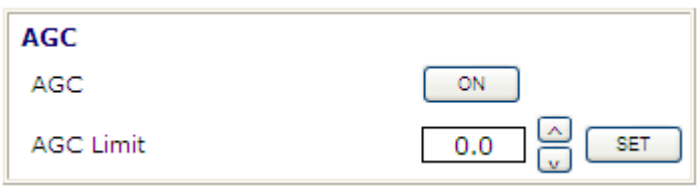
<Figure 10-13> LPA

Below are items that are included in the LPA section for monitoring and control.

Item	Unit	Notes
LPA Enable	[ON / OFF]	Monitoring/Control
LPA Power	[dBm]	Monitoring/Control
LPA Power Limit	[dBm] [Green: Normal, Red: Alarm]	Monitoring/Control Monitoring

2.6.3 AGC

Monitoring and control for AGC Status.



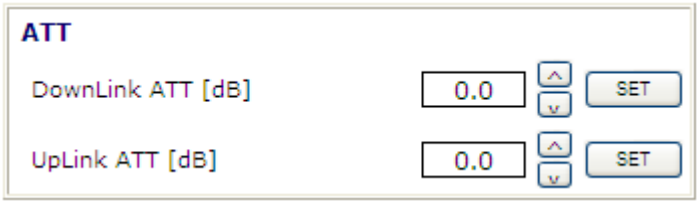
<Figure 10-14> AGC

Below are items that are included in the AGC section for monitoring and control.

Item	Unit	Notes
AGC	[ON / OFF]	Monitoring/Control
AGC Limit		Monitoring/Control

2.6.4 ATT

Monitoring and control for ATT status.



<Figure 10-15> ATT

Below are items that are included in the ATT section for monitoring and control.

Item	Unite	Notes
Down Link ATT	[dB]	Monitoring/Control
Up Link ATT	[dB]	Monitoring/Control

2.6.5 PLL

Monitoring for PLL status.

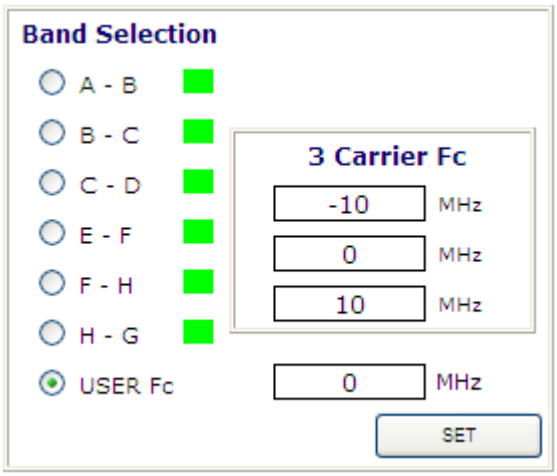
<Figure 10-16> PLL

Below are items that are included in the PLL section for monitoring and control.

Item	Unit	Notes
Enable A	[ON / OFF]	Monitoring
Enable B	[ON / OFF]	Monitoring

2.6.6 Band Selection

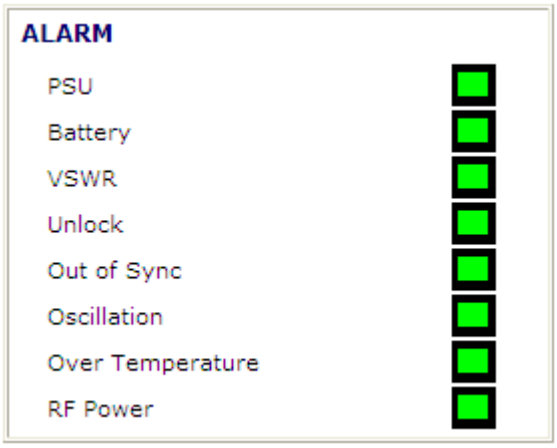
Desired Band can be selected or frequencies can be typed in.



<Figure 10-17> Band Selection

2.6.7 ALARM

Display for ALARM status.



<Figure 10-18> ALARM

Below are items that are included in the Alarm section for monitoring and control.

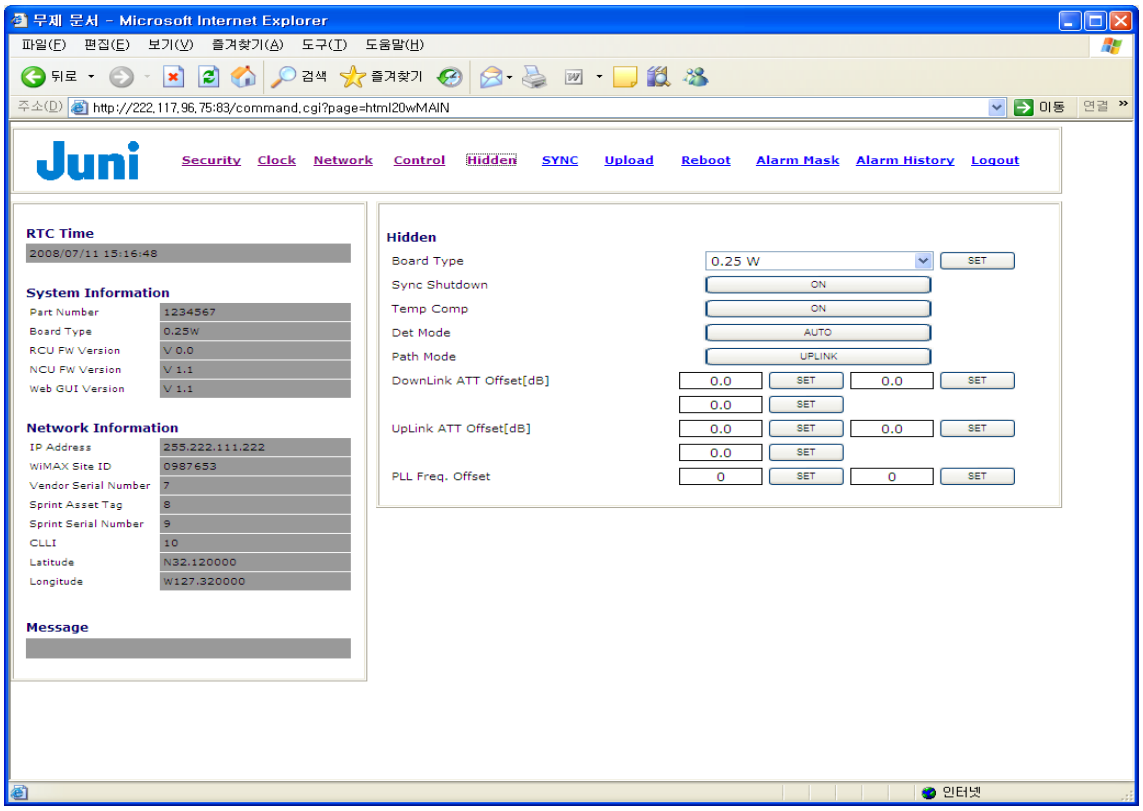
Item	Unite	Notes
PSU	[Green: Normal, Red: Alarm]	Monitoring
Battery	[Green: Normal, Red: Alarm]	Monitoring
VSWR	[Green: Normal, Red: Alarm]	Monitoring
Unlock	[Green: Normal, Red: Alarm]	Monitoring
Out of Sync	[Green: Normal, Red: Alarm]	Monitoring
Oscillation	[Green: Normal, Red: Alarm]	Monitoring
Over Temperature	[Green: Normal, Red: Alarm]	Monitoring
RF Power	[Green: Normal, Red: Alarm]	Monitoring

2.7 Hidden

For the system’s hidden items, status can be monitored or controlled in the ‘ Hidden’ menu. Roughly for every 15 seconds, data is sent, received and updated on this page.

When a user wants to control or change a setting, the moment a control item is clicked or a value is changed, communication with the repeater is momentarily halted. The repeater would then wait for a control command.

When the values have been added or changed within the item’s appropriate range, [Set] button is clicked. This will forward a control command to the repeater. In situations where [SET] button is not clicked, after 10 seconds, system recommences communication.



<Figure 10-19> Hidden

Below are items that are included in the Hidden page for monitoring and control.

Item	Unit	Notes
Board Type		Monitoring/Control

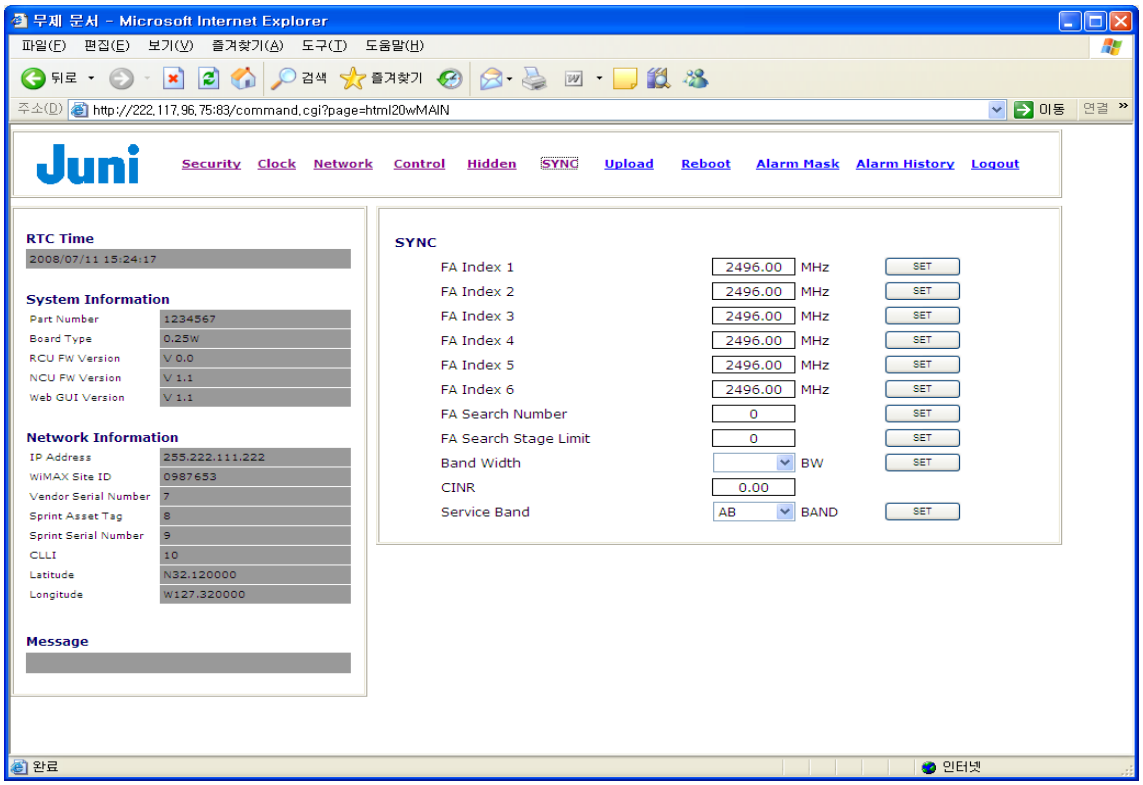
Sync Shutdown	[ON / OFF]	Monitoring/Control
Temp Comp	[ON / OFF]	Monitoring/Control
Det Mode	[AUTO / MANUAL]	Monitoring/Control
Path Mode	[DOWNLINK / UPLIINK]	Monitoring/Control
Down Link ATT Offset	[dB]	Monitoring/Control
Up Link ATT Offset	[dB]	Monitoring/Control
PLL Freq. Offset		Monitoring/Control

2.8 SYNC

For the system’s SYNC, status can be monitored or controlled in the ‘SYNC’ menu. When the page is first displayed, status data is shown.

When a user wants to control or change a setting, the moment a control item is clicked or a value is changed, communication with the repeater is momentarily halted. The repeater would then wait for a control command.

When values have been added or changed within the item’s appropriate range, [Set] button is clicked. This will forward a control command to the repeater.



<Figure 10-20> Hidden

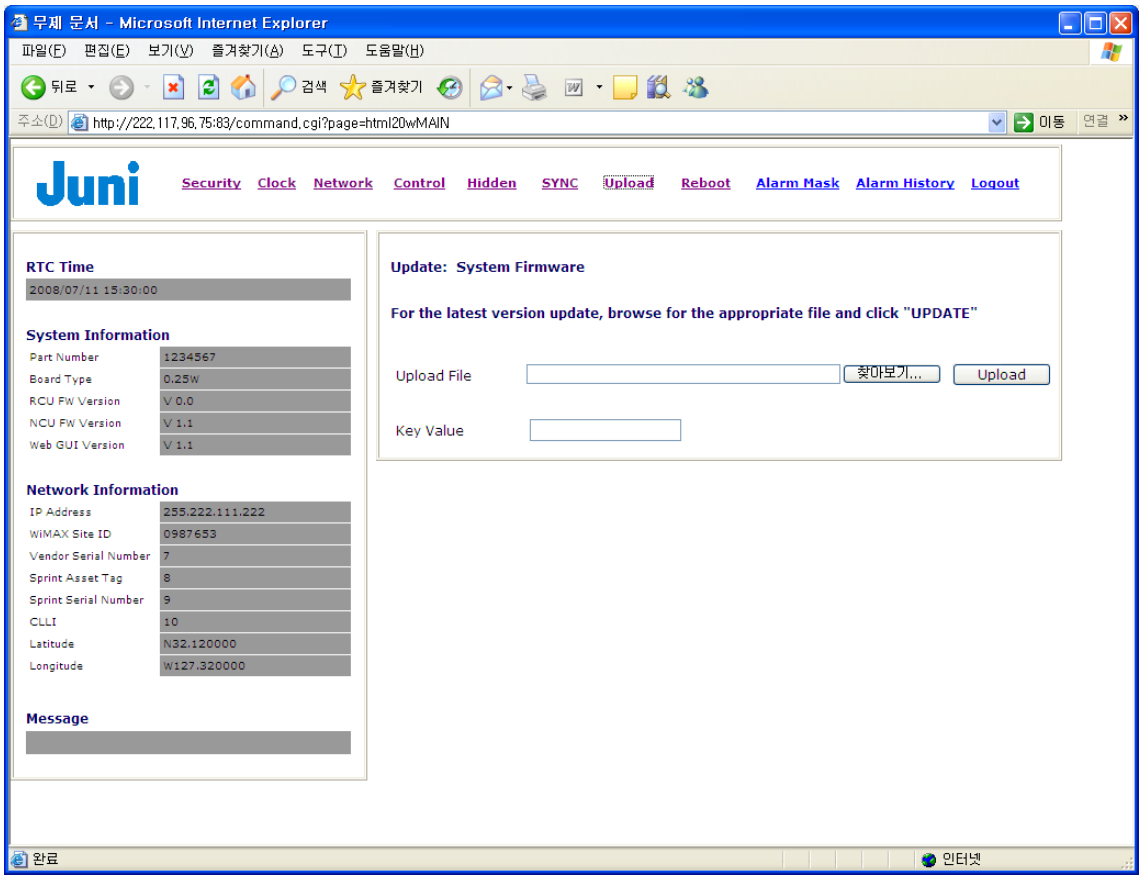
Below are items that are included in the SYNC page for monitoring and control.

Item	Unit	Notes
FA Index 1	[MHz]	Monitoring/Control
FA Index 2	[MHz]	Monitoring/Control
FA Index 3	[MHz]	Monitoring/Control

FA Index 4	[MHz]	Monitoring/Control
FA Index 5	[MHz]	Monitoring/Control
FA Index 6	[MHz]	Monitoring/Control
FA Search Number		Monitoring/Control
FA Search Stage Limit		Monitoring/Control
Band Width	[BW]	Monitoring/Control
CINR		Monitoring
Service Band	[BAND]	Monitoring/Control

2.9 Upload

If the [Upload] link is clicked, a page will open whereby system F/W update can be executed.



<Figure 10-21> Upload

Definitions of each item are available below.

찾아보기 (Search) : a window will open so that a file can be selected for Upload.

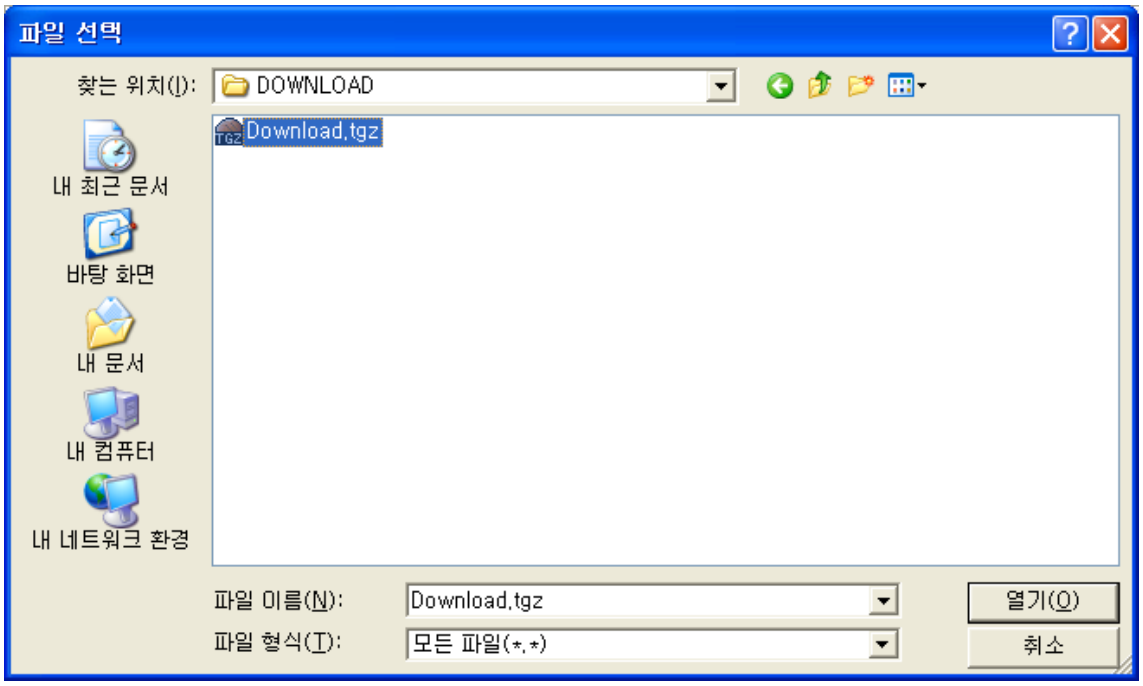
Upload : Selected file will upload onto the system.

Upload File Name : Selected File path

Key value : Selected File’s error check key value

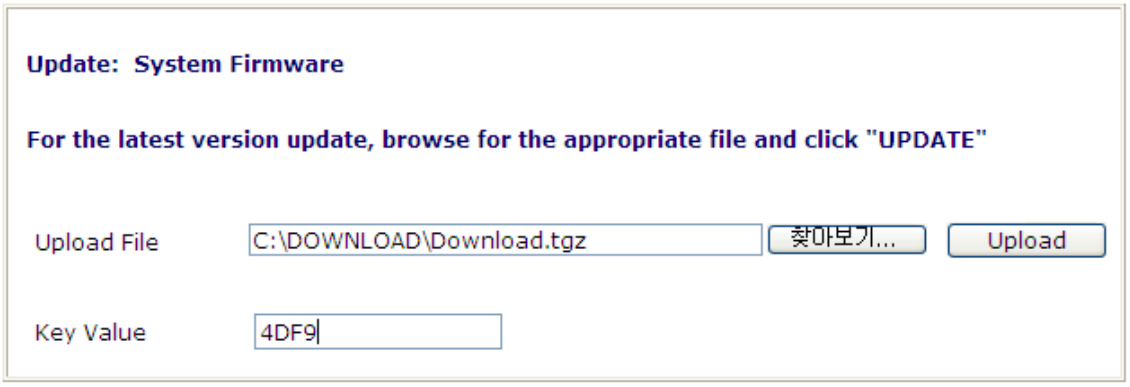
2.9.1 File Selection

When the [찾아보기] button in <Figure 10-21> is clicked, a window like the one below appears. Here, desired system upload files can be selected. These uploadable file's extension is ' .tgz'.



<Figure 10-22> Upload File Selection

2.9.2 File Information



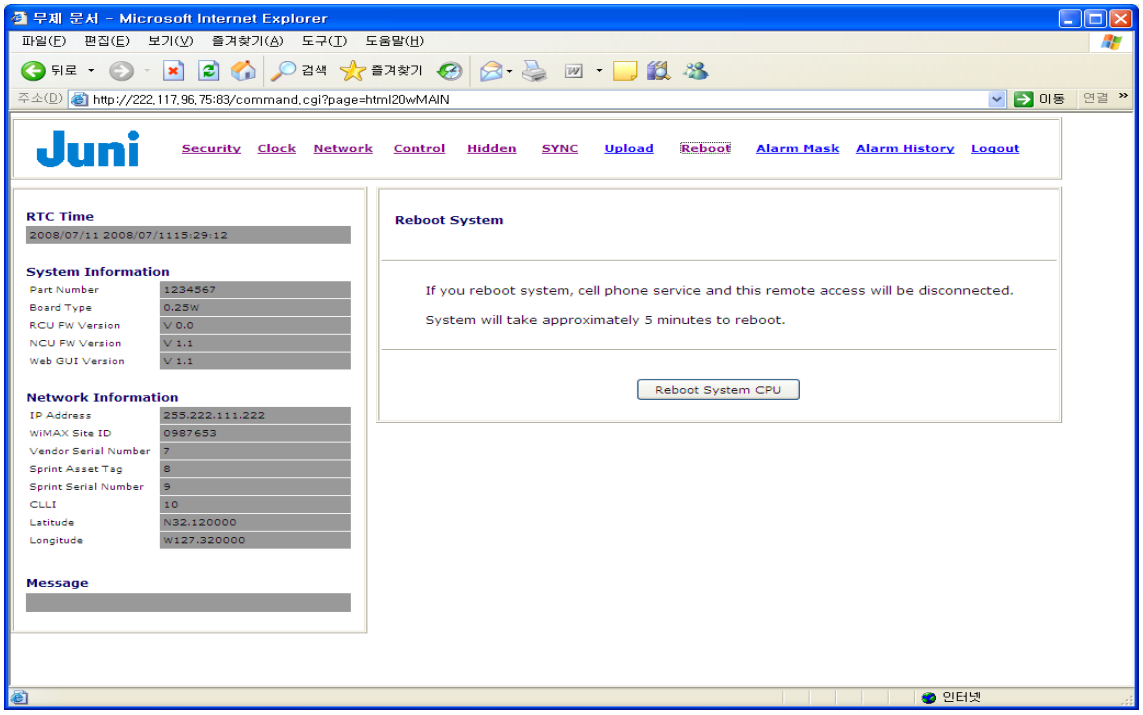
<Figure 10-23> Upload File Information

Each supplied upload files are allocated with 4 distinguishing key values. These key values and the upload files are checked. If they are not correct, upload action is denied.

When the [Upload] button is clicked, system upload is initiated. Once the upload is complete, the system will reboot.

2.10 Reboot

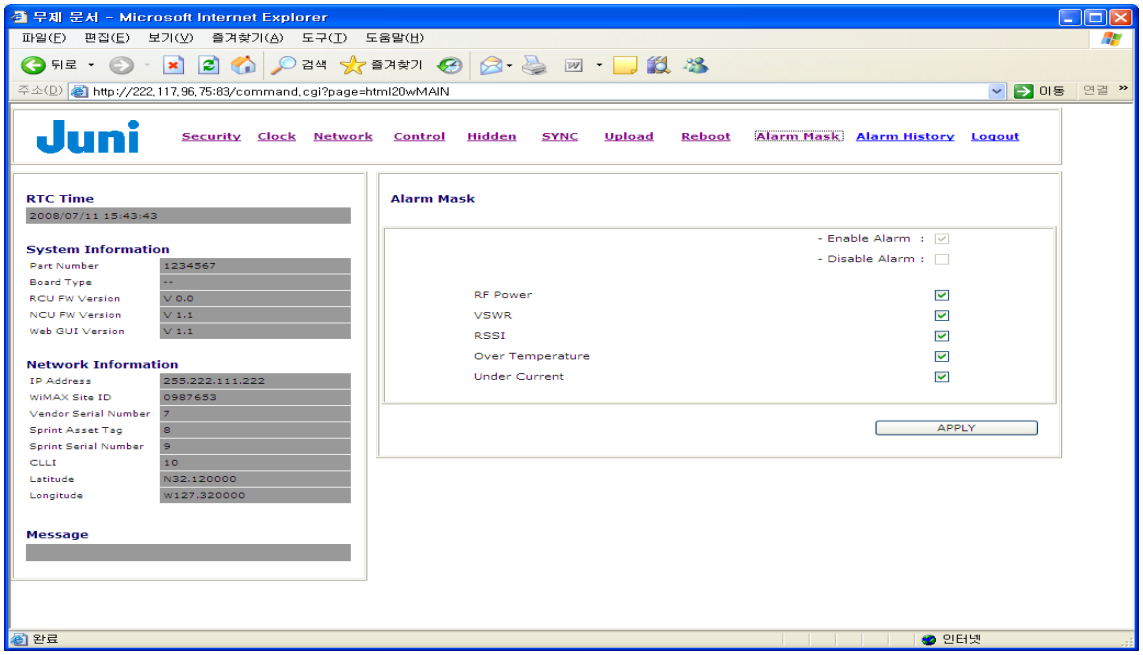
When [Reboot] link in the main menu is clicked, a page will be displayed whereby the system can reboot. Within this page, if [Reboot System CPU] button is clicked, system will reboot.



<Figure 10-24> Reboot

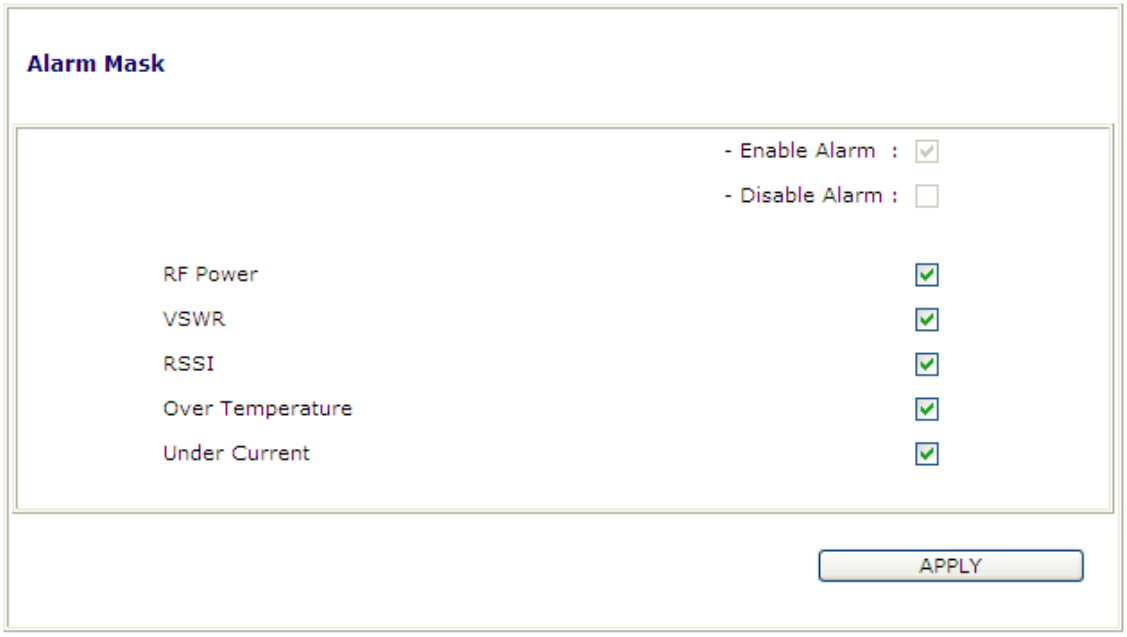
2.11 Alarm Mask

In the main menu, when [Alarm Mask] link is clicked, ‘ Alarm Mask’ page is displayed.



<Figure 10-25> Alarm Mask

Once the desired alarms for masking are checked, click on the apply button.



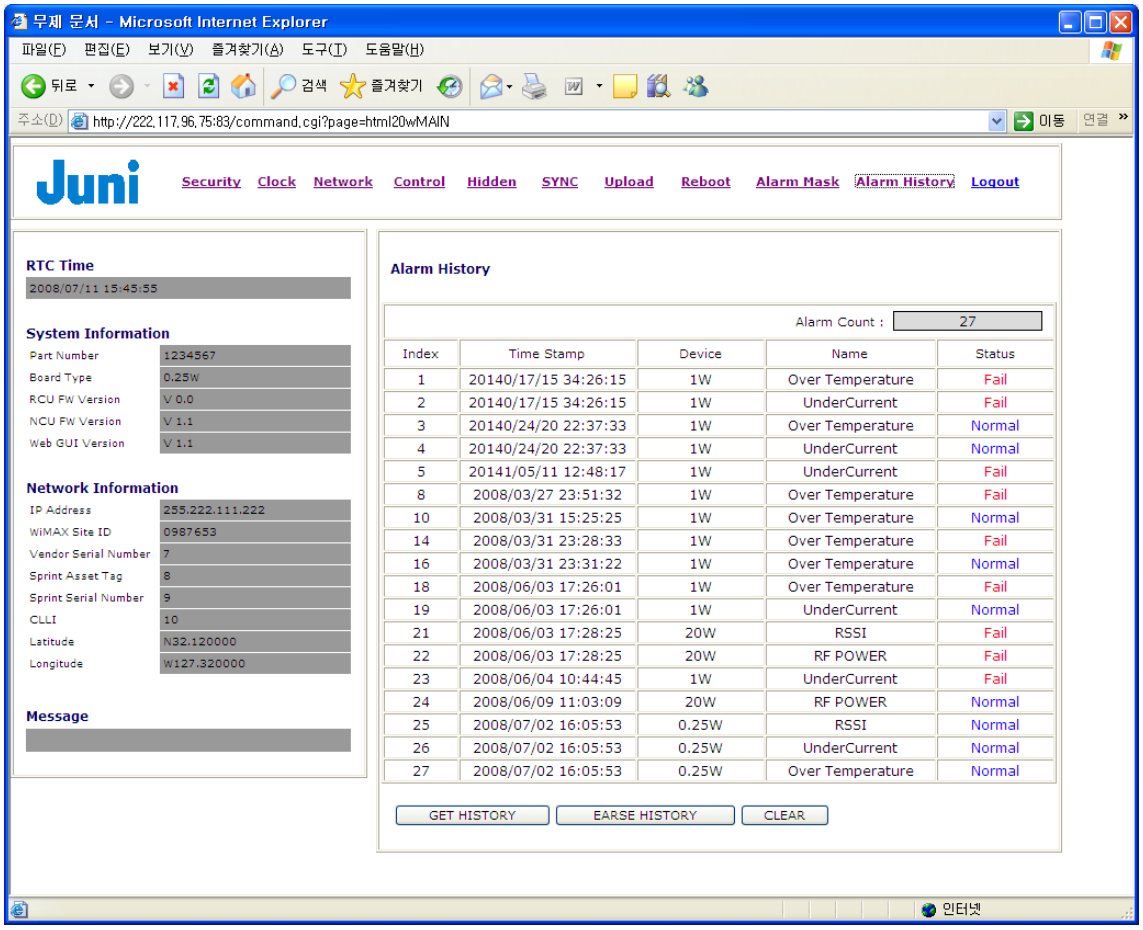
<Figure 10-26> Alarm Mask Setup

Below are items that are included in Alarm Mask section for monitoring and control.

Item	Notes
RF Power	
VSWR	
RSSI	
Over Temperature	
Under Current	

2.12 Alarm History

In the main menu, when [Alarm History] link is clicked, ‘ Alarm History’ page is displayed. Any alarms that occur during the operation of the repeater will be logged in this page.



<Figure 10-27> Alarm History

Functions and explanations of each button are provided below.

GET HISTORY : Alarm histories that are saved in the system are displayed.

EARSE HISTORY : Alarm histories that have been saved in the system are deleted.

CLEAR : Initialization of List.

8. FCC Compliance Statements

Note: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Modifications not expressly approved by the manufacturer could void the user's authority to operated the equipment under FCC rules.
