## Report Scope

This report addresses the EMC verification testing and test results of the Audiovox Remote, herein referred to as EUT (Equipment Under Test) performed at Global EMC Labs.

The EUT was tested for compliance against the following standards:

RSS 210 Issue 7:2007 / FCC Part 15 Subpart C 15:2010

Test procedures, results, justifications, and engineering considerations, if any, follow later in this report.

The results contained in this report relate only to the item(s) tested.

This report does not imply product endorsement by A2LA or any other accreditation agency, any government, or Global EMC Inc.

Opinions/interpretations expressed in this report, if any, are outside the scope of Global EMC Inc accreditation. Any opinions expressed do not necessarily reflect the opinions of Global EMC Inc, unless otherwise stated.

Standard(s)	RSS 210 Issue 7:2007 / FCC Part 15 Subpart C 15:2010	

## Test Results Summary

Standard/Method	Description	Class/Limit	Result
FCC 15.203 RSS 210 Section 5.5	Antenna Requirement	Unique	Pass See Justification
FCC 15.205 RSS 210 Section 6.3 (Table 2)	Restricted Bands for intentional operation	None within chart	Pass See Justification
FCC 15.207 RSS 210 Section 6.6	Power line conducted emissions	QuasiPeak Average	Pass
FCC 15.209 RSS 210 Section 6.2.1 (Tables 3 & 7)	Radiated emissions	QuasiPeak Average	Pass
FCC 15.247(a)(1) RSS 210 6.2.2(o)	Channel Separation	> 25 kHz	Pass
FCC 15.247(a)(1)(i) RSS 210 6.2.2(o)	Number of channels	> 50	Pass
FCC 15.247(a)(1)(i) RSS 210 6.2.2(o)	Time of occupancy	< 400 mSec in 20 sec period	Pass
FCC 15.247(b) RSS 210 6.2.2(o)	Max output power	< 1 Watt	Pass
FCC 15.247(b)(4) RSS 210 6.2.2(o)	Antenna Gain	< 6 dBi	Pass See Justification
FCC 15.247(d) RSS 210 6.2.2(d)	Antenna conducted spurious	> 20 dBc	Pass
FCC 15.247(h)	FHSS Intelligence	No coordination	Pass See Justification
FCC 15.247(i) IC Safety code 6	Maximum Permissible Exposure	> 20 cm separation.	Pass See justification
<b>Overall Result</b>			<b>PASS</b>

Client	Unify4Life
Product	Audiovox Remote ARRZ300IP
Standard(s)	RSS 210 Issue 7:2007 / FCC Part 15 Subpart C 15:2010

All tests were performed by Raymond Lee Au.

If the product as tested or otherwise complies with the specification, the EUT is deemed to comply with the requirement and is deemed a 'PASS' grade. If not 'FAIL' grade will be issued. Note that 'PASS' / 'FAIL' grade is independent of any measurement uncertainties. A 'PASS' / 'FAIL' grade within measurement uncertainty is marked with a '\*'.

### ***Justifications, Descriptions, or Deviations***

The following justifications for tests not performed or deviations from the above listed specifications apply:

For the Antenna requirement specified in FCC 15.203 (RSS 210 section 5.5), this device uses a SMT chip antenna, and has no provisions for end-user replacement.

For the Restricted Bands of operation, the EUT is designed to only operate between 2.4 to 2.4835 GHz band.

For the Antenna gain, the stated gain according to the antenna manufacturer is less than 6 dBi. The EUT was flipped vertically and horizontally in order to obtain the maximum emissions.

For maximum permissible exposure, this device operates at less than 1 Watt and is designed to operate greater than 20 cm from personnel during normal operation. No testing is required, however worst case calculated exposure compliance follows later in this report.

The EUT is not a hybrid system and FCC 15.247 (f) does not apply to it. However the 15.247 (d) requirement of power density were met and are detailed in this test report.

This device was tested at both 2401 and 2402 MHz, and no difference was observed other than a frequency shift of 1 MHz. The worst case results for 2401 MHz are presented in this report as representative. The device also passes at 2402 MHz.

Product	Audiovox Remote ARRZ300IP
Standard(s)	RSS 210 Issue 7:2007 / FCC Part 15 Subpart C 15:2010

## ***Sample calculation(s)***

Margin = limit – (received signal + antenna factor + cable loss – pre-amp gain)

Margin = 50.5dBuV/m – (50dBuV + 10dB + 2.5dB – 20dB)

Margin = 8.5 dB

## ***Document Revision Status***

Revision 1 - September 3, 2010

Client	Unify4Life
Product	Audiovox Remote ARRZ300IP
Standard(s)	RSS 210 Issue 7:2007 / FCC Part 15 Subpart C 15:2010

## Definitions and Acronyms

The following definitions and acronyms are applicable in this report.  
See also ANSI C63.14.

**AE** – Auxillary Equipment.

**BW** – Bandwidth. Unless otherwise stated, this is refers to the 6 dB bandwidth.

**EMC** – Electro-Magnetic Compatibility

**EMI** – Electro-Magnetic Immunity

**EUT** – Equipment Under Test

**ITE** – Information Technology Equipment with a primary function(s) of entry, storage, display, retrieval, transmission, processing, switching, or control, of data.

**LISN** – Line impedance stabilization network

**NCR** – No Calibration Required

**RF** – Radio Frequency

Client	Unify4Life

Standard(s)	RSS 210 Issue 7:2007 / FCC Part 15 Subpart C 15:2010

## Testing Facility

Testing for EMC on the EUT was carried out at Global EMC labs in Toronto, Ontario, Canada. The testing lab consists of a 3m semi-anechoic chamber calibrated to be able to allow measurements on an EUT with a maximum width or length of up to 2m and height up to 3m. The chamber is equipped with a turn table that is capable of testing devices up to 3300lb in weight. This facility is capable of testing products that are rated for 120 Vac and 240Vac single phase, or 208 Vac 3 phase input. DC capability is also available. The chamber is equipped with an antenna mast that controls polarization and height from the control room adjoining the shielded chamber. Radiated emissions measurements are performed using a Bilog, and Horn antenna where applicable. Conducted emissions, unless otherwise stated, are performed using a LISN.

## ***Calibrations and Accreditations***

The measurement site used is registered with Federal Communications Commission (FCC) and Industry Canada (IC). This site is calibrated for Normalized Site Attenuation (NSA) using test procedures outlined in ANSI C63.4 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The semi-anechoic chamber is lined with ferrite tiles and absorption cones to minimize any undesired reflections. All measuring equipment is calibrated on an annual or bi-annual basis as listed for each respective test. Global EMC is accredited by A2LA for testing as listed on the A2LA website.

## ***Spurious Radiated Emissions***

### **Purpose**

The purpose of this test is to ensure that the RF energy unintentionally emitted from the EUT does not exceed the limits listed below as defined in the applicable test standard, as measured from a receiving antenna. This helps protect broadcast radio services such as television, FM radio, pagers, cellular telephones, emergency services, and so on, from unwanted interference.

### **Limit(s) and Method**

The method is as defined in ANSI C63.4:2003.

The limits, as defined in 15.247(d) for unintentional radiated emissions apply for those emissions that fall in the restricted bands, as defined in Section 15.205(a). These emissions must comply with the radiated emission limits specified in Section 15.209(a).

All unintentional emissions must also meet the ‘Spurious Conducted Emissions’ requirements of -20 dBc or greater. See also ‘Spurious Conducted Emissions’ for further details.

30 MHZ – 88 MHz, 100 uV/m (40.0 dB<sub>u</sub>V/m<sup>1</sup>) at 3 m

88 MHz – 216 MHz, 150 uV/m (43.5 dB<sub>u</sub>V/m<sup>1</sup>) at 3 m

216 MHz – 960 MHz, 200 uV/m (46.4 dB<sub>u</sub>V/m<sup>1</sup>) at 3 m

Above 960 MHz, 500 uV/m (54.0 dB<sub>u</sub>V/m<sup>1</sup>) at 3 m

Above 1000 MHz, 500 uV/m (54.0 dB<sub>u</sub>V/m<sup>2</sup>) at 3m

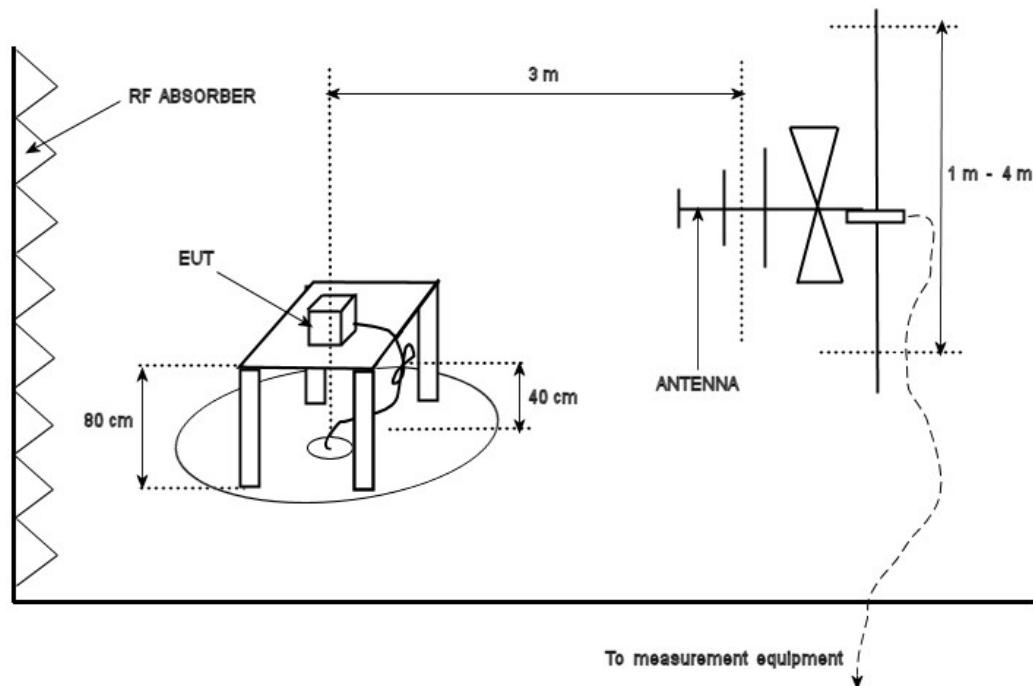

<sup>1</sup>Limit is with 120 kHz measurement bandwidth and a using a Quasi Peak detector.

<sup>2</sup>Limit is with 1 MHz measurement bandwidth and using an Average detector, scanned in accordance with 15.33 to above the 10<sup>th</sup> harmonic (26 GHz).

Product	Audiovox Remote ARRZ300IP
Standard(s)	RSS 210 Issue 7:2007 / FCC Part 15 Subpart C 15:2010

## Measurement Uncertainty

The expanded measurement uncertainty is calculated in accordance with CISPR 16-4-2 and is +/-4.4 dB with a 'k=2' coverage factor and a 95% confidence level.

## Preliminary Graphs

Note the graphs shown below are for graphical illustration only. For final measurements with the appropriate detector, please refer to the final measurement table where applicable. The graph shown below is a maximized peak measurement graph, measured with a resolution bandwidth greater than the final required detector and over a full 0-360° rotation. This peaking process is done as a worst case measurement. This process enables the detection of frequencies of concern for final measurement, and provides considerable time savings.

In accordance with FCC Part 15, Subpart A, Section 15.33, the device was scanned to a minimum of a 26 GHz.

Low, middle, and high modes as well as frequency hopping was investigated, however the worst case graphs are presented.

## Final Measurements

Note: In accordance with 15.247(d), only radiated emissions exceeding the 15.209 limit that occur within the bands listed in 15.205, need to be verified with a quasi-peak detector or an average detector.

The requirement of -20dBc is verified by the conducted method, please see 'Spurious Antenna Conducted Emissions' section of this report.

The frequency shown on the peak graphs between 2000 – 2500 MHz, which are above the 15.209 limits, falls at 2400 MHz, which are not within the restricted bands as listed in FCC 15.205 and does not need to be verified.

For information purposes, the fundamental was measured to be 76.9 dBuV/m at 3 meters, and none of the unintentional radiated emissions that fall outside of the restricted bands exceeded the -20dBc (or 56.9dBuV/m) requirement.

The following measurements were made at the harmonics shown in the above graphs.

See 'Spurious Antenna Conducted Emissions' measurements for -20 dBc requirements.

## ***Channel Carrier Separation for Frequency Hopping Systems***

### **Purpose**

The purpose of this test is to ensure that the RF energy of frequency hopping systems is sufficiently spread over a spectrum and that the radio energy is not overly dense. This limit helps allow for other spread spectrum devices to co-exist in the same frequency spectrum. This also helps prevent corruption of data by ensuring adequate channel separation to distinguish the reception of the intended information.

### **Limits**

The limits are as defined in 47 CFR FCC Part 15 Section 15.247(a)(1)

No conditions	902 to 928 MHz	2.4 to 2.4835 GHz	5.275 to 5.85 GHz
< 125 mW	25 kHz or 20 dB BW <sup>1</sup>	25 kHz or 20 dB BW <sup>1</sup>	25 kHz or 20 dB BW <sup>1</sup>

25 kHz or 20 dB BW<sup>1</sup>      25 kHz or 2/3 of 20 dB BW<sup>1</sup>      25 kHz or 20 dB BW<sup>1</sup>

Note 1: Whichever is greater. The 20 dB BW of the system was measured to be 720 kHz, so a limit of 720 kHz applies.

### **Results**

The EUT passed the requirements of channel carrier spacing exceeding the measured 20 dB BW of the EUT. The 20 dB BW previously measured was 720 kHz, and the device had a channel spacing of 1.0 MHz.

## Graph(s)

The graphs shown below shows the channel spacing during the operation of the device. This is measured by a max hold on the spectrum analyzer and the highest resolution bandwidth that is sufficiently low to exhibit the channel spacing of the signal being measured. This measurement is a peak measurement. Max hold is performed for a duration of not less then 1 minute.

Note: See 'Appendix B – EUT & Test Setup Photographs' for photos showing the test set-up.

## **Maximum Peak Envelope Conducted Power**

### **Purpose**

The purpose of this test is to ensure that the maximum power conducted to the radiating element does not exceed the limits specified.

### **Limits**

The limits are defined in 15.247(b).

For frequency hopping systems operating in the 902-928 MHz band employing more than 50 hopping channels, the peak limit is 1 watt.

### **Results**

The EUT passed. The peak power measured was -0.6 dBm (0.9 mW).

## ***Spurious Conducted Emissions***

### **Purpose**

The purpose of this test is to ensure that the maximum power conducted to the radiating element does not exceed the limits specified.

### **Limits**

The limits are defined in 15.247(d).

In any 100 kHz band, the peak spurious harmonics emissions must be at least 20 dB below the fundamental.

### **Results**

The EUT passed the requirements. Low, middle, high bands, and hopping were measured. The worst case is presented as a graph for the spectrum.

The -20 dBc requirement is shown for the lower band edge at 2.401 GHz in the low band and at 2.480 GHz in the high band.

### **Graph(s)**

The graphs shown below shows the peak power output of the device during the antenna conducted measurement during transmit operation of the EUT.

## ***Frequency Occupancy for Frequency Hopping Systems***

### **Purpose**

The purpose of this test is to ensure that the RF energy of frequency hopping systems is hopping at a minimum defined rate. This helps ensure sufficient time off to enable other frequency hopping devices to co-operate within this allocated band.

### **Limits**

For 2400 – 2483.5 MHz systems, the limits are as defined in 47 CFR FCC Part 15 Section 15.247(a)(1)(iii).

For frequency hopping systems in 2400 – 2483.5 MHz, the unit shall use at least 15 channels. The average time of occupancy shall not be greater than 0.4s in a period of 0.4s X # of channels occupied.

### **Results**

The EUT passed the requirements. The EUT cycles through its pseudo-random generated list of hopping frequencies. There are 79 channels occupied in total. The average occupancy time is 0.38 ms per channel and each channel is repeated every 99.18 ms.

The complete observation time is

$$\begin{aligned}
 &= \# \text{ of channels} \times 400 \text{ ms} \\
 &= 79 \times 400 \text{ ms} \\
 &= 31,600 \text{ ms} \\
 &= 31.6 \text{ s}
 \end{aligned}$$

$$\begin{aligned}
 \text{Number of time a channel is occupied in 31.6s} &= 31.6s / 99.11ms \\
 &= 31600 \text{ ms} / 98.18ms \\
 &= 318.87 \text{ times.}
 \end{aligned}$$

$$\begin{aligned}
 \text{Total occupancy time in 31.6 s is} \\
 &= 318.87 \times 0.38 \text{ ms} \\
 &= 121.17 \text{ ms}
 \end{aligned}$$

The EUT has an average occupancy of 121.17 msec within a 31.6 second period. This is under the 400 msec limit as per 15.247 (a) 1 (iii)

## ***Number of Channels for Frequency Hopping Systems***

### **Purpose**

The purpose of this test is to ensure that the RF energy of frequency hopping systems is sufficiently spread over a spectrum and that the radio energy is not overly dense. This limit helps allow for other spread spectrum devices to co-exist in the same frequency spectrum. This also helps prevent corruption of data by ensuring adequate channel separation to distinguish the reception of the intended information.

### **Limits**

The limits are as defined in 47 CFR FCC Part 15 Section 15.247(a)(1)

	902 to 928 MHz	2.4 to 2.4835 GHz	5.275 to 5.85 GHz
No conditions	>= 50 channels	>= 15 channels	>= 75 channels
20 dB BW	>= 25 channels	>= 15 channels	>= 75 channels
exceeds 250 kHz			

### **Results**

The EUT passed the requirements of the number of channels. The number of channels the device occupies is 79 channels in the allocation band of 2400 MHz – 2483.5 MHz.

## ***Channel Carrier Bandwidth of Frequency Hopping Systems***

### **Purpose**

The purpose of this test is to allow for results that are used to help establish other limits. Although there is not specific limit for this requirement, the derived limits dependant on this information helps allow for other spread spectrum devices to co-exist in the same frequency spectrum. This also helps prevent corruption of data by ensuring adequate channel separation to distinguish the reception of the intended information.

### **Limits**

There is no specified limit. However, an approximate calculated maximum limit can be obtained by dividing the maximum bandwidth of the frequency allocation by the minimum number of channels. Note that this is a maximum bandwidth, and the measurement is used to calculate other limits.

902 to 928 MHz <sup>1</sup>	902 to 928 MHz <sup>2</sup>	2.4 to 2.4835 GHz	5.725 GHz to 5.85 GHz
26 MHz / 50	26 MHz / 25	83.5 MHz / 15	125 MHz / 75
520 kHz	1.04 MHz	5.57 MHz	1.67 MHz

Note 1: When the 20 dB BW is less then 250 kHz

Note 2: When the 20 dB BW is greater then 250 kHz

### **Results**

The EUT passed. The 20 dB BW measured was 720 kHz.

## ***Maximum Permissible Exposure***

### **Purpose**

The purpose of this test is to ensure that the RF energy intentionally transmitted, in terms of power density emitted from the EUT at a stated operating distance does not exceed the limits listed below as defined in the applicable test standard, as calculated based upon readings obtained during testing. This helps protect human exposure to excessive RF fields.

### **Limit(s) and Method**

The limits, as defined in FCC 15.247(i), and FCC 1.1310 Table 1 (B) limits for general public exposure was applied. The limit for the frequency range of 1.5 GHz to 100 GHz was applied. This is a limit of 1.0 mW/ cm<sup>2</sup>. The distance used for calculations was 20cm, as this is the minimum distance an operator will be from the EUT during normal operation, as stated by the manufacturer.

Client	Unify4Life	
Product	Audiovox Remote ARRZ300IP	
Standard(s)	RSS 210 Issue 7:2007 / FCC Part 15 Subpart C 15:2010	

## Results

The EUT passed the requirements. The worst case calculated power density was 0.0003 mW/cm<sup>2</sup>, this is significantly under the 1.0 mW/cm<sup>2</sup> requirement.

## Calculations

Method 1 (conducted power)

$$P_d = (P_t * G) / (4 * \pi * R^2)$$

Where Pt = -0.6 dBm or 0.9 mW as per Peak power conducted output

Where G = 2.4 dBi, or numerically 1.74

Where R = 20 cm

$$P_d = (0.9 \text{ mW} * 1.74) / (4 * \pi * 20 \text{ cm}^2)$$

$$P_d = 1.566 \text{ mW} / 5026 \text{ cm}^2$$

$$P_d = 0.0003 \text{ mW/cm}^2$$

Client	Unify4Life
Product	Audiovox Remote ARRZ300IP
Standard(s)	RSS 210 Issue 7:2007 / FCC Part 15 Subpart C 15:2010

## ***Power Line Conducted Emissions***

### **Purpose**

The purpose of this test is to ensure that the RF energy unintentionally emitted from the EUT's power line does not exceed the limits listed below as defined in the applicable test standard, as measured from a LISN. This helps protect lower frequency radio services such as AM radio, shortwave radio, amateur radio operators, maritime radio, CB radio, and so on, from unwanted interference.

### **Limits & Method**

The limits are as defined in 47 CFR FCC Part 15 Section 15.207

Method is as defined in ANSI C64:2003

Average Limits		QuasiPeak Limits	
150 kHz – 500 kHz	56 to 46 dBuV	150 kHz – 500 kHz	66 to 56 dBuV
500 kHz – 5 MHz	46 dBuV	500 kHz – 5 MHz	56 dBuV
5 MHz – 30 MHz	50 dBuV	500 kHz – 30 MHz	60 dBuV

The limit decreases linearly with the logarithm of the frequency in the range 0.15 MHz to 0.50 MHz.

Note: If the Peak or Quasi Peak detector measurements do not exceed the Average limits, then the EUT is deemed to have passed the requirements.

Both limits are applicable, and each is specified as being measured with a 9 kHz measurement bandwidth.

## Appendix A – EUT Summary

For further details for filing purposes, refer to filing package.

### General EUT Description

Client Details	
Organization / Address	Unify4Life Corporation 130 Esna Park Drive Markham, Ontario, L3R 1E3
Contact	Minh Doan
Phone	905.940.1117
Email	mdoan@unify4life.com
EUT Details	
<b>EUT Model number</b>	ARRZ300IP
<b>Equipment Category</b>	Residential
<b>Basic EUT Functionality</b>	The EUT allows the end user to control their home entertainment devices via Bluetooth functionality.
<b>Input Voltage and Frequency</b>	120V 60Hz via DC adaptor
<b>Connectors available on EUT</b>	DC input
<b>Peripherals Required for Test</b>	None.
<b>Release type</b>	Final
<b>Intentional Radiator Frequency</b>	2401 – 2480.0 MHz for Bluetooth protocol.

Note the EUT is considered to have been received the date of the commencement of the first test, unless otherwise stated. For a close-up picture of the EUT, see ‘Appendix B – EUT & Test Setup Photographs’.
