

Description

1. The power source manages a circuit

Automobile storage battery 12-24V samplings give IC 6 feet to import, the stabilivolt queen exports standard voltage by that IC brings the pressure down from 2 feet (5.2-5.4V). This voltage gives first place to with parting for charge board current supply and launch

2. Master control manages a circuit

- 1). SDU set data signal decoding is become exporting under the control of together signal;
- 2). The data carries out decoding on received remote control by the fact that IR1 admits the head, controls and the corresponding circuit job;
- 3). Launch frequency by the fact that the body commotio circuit producing and controlling TX;
- 4). Every function controlling the S1-S4 button by button interface

3. The launch manages a circuit(HY1418 + HY1428)

HY1418 IC is that high frequency produced by circuit uses high frequency Guan Fang high-power and reason air wire to launch then in high frequency commotio in the wave mainly with an audible signal loading exported by master control, give reception equipment to admit.

HY1428 IC is that uses then lock TX frequency.
