### **Maximum Permissible Exposure Evaluation**

# Maximum Permissible Exposure Evaluation

Power Density at Specific Separation:

$$S = PG/(4R^2\pi)$$

Where S = Maximum power density (mW/cm<sup>2</sup>)

P = Power input to the antenna (mW)

G = Numeric power gain of the antenna

R = Distance to the center of the antenna = 20 cm

Measured maximum output power (P) is 2.44dBm = 1.75mW

The Numeric power gain of the antenna (G) is 5dB = 3.16

$$S = (1.75 * 3.16) / (4 * 20^2 * \pi)$$

$$S = 0.0011 \text{ (mW/cm}^2\text{)}$$

The maximum permissible exposure (MPE) for the general population is 1 mW/cm<sup>2</sup>.  
The power density at 20 cm distance to the center of the antenna does not exceed the 1 mW/cm<sup>2</sup>. Therefore, the exposure condition is compliant with FCC rules.
