Test Report

Certification

Test Of: IceQube

FCC ID: WWP-ICEQUBE

Test Specification: FCC PART 15, Subpart C

Test Report Serial No: 234767-3.2

Applicant:

IceRobotics Ltd
Bankhead Steading
Bankhead Road
South Queensferry
Edinburgh EH30 9TF
United Kingdom

Date of Test: April 4 & 8-11, 2013

Report Issue Date: April 24, 2013

Accredited Testing Laboratory By:

NVLAP Lab Code 100272-0

CERTIFICATION OF ENGINEERING REPORT

This report has been prepared by Nemko-CCL, Inc. to document compliance of the device described below with the requirements of Federal Communications Commission (FCC) Part 15, Subpart C. This report may be reproduced in full; partial reproduction may only be made with the written consent of the laboratory. The results in this report apply only to the sample tested.

- Applicant: IceRobotics Ltd
- Manufacturer: IceRobotics Ltd
- Brand Name: IceRobotics
- Model Number: IceQube
- FCC ID Number: WWP-ICEQUBE

On this 24th day of April 2013, I, individually and for Nemko-CCL, Inc., certify that the statements made in this engineering report are true, complete, and correct to the best of my knowledge, and are made in good faith.

Although NVLAP has recognized that the Nemko-CCL, Inc. EMC testing facilities are in good standing, this report must not be used to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the federal government.

Nemko-CCL, Inc.

South Queensferry
Edinburgh EH30 9TF
United Kingdom

Contact Name: Fraser Arnot
Title: Operations Manager

SECTION 2.0 EQUIPMENT UNDER TEST (EUT)**2.1 Identification of EUT:**

Brand Name:	IceRobotics
Model Number:	IceQube
Dimensions:	5.5 cm x 5.5 cm x 2.5 cm
Country of Manufacture:	United Kingdom

2.2 Description of EUT:

The IceQube acquires data logs of animal movements, and together with the CowAlert System, enables the collection and analysis of such data. The CowAlert System comprises a 128 kHz antenna, an antenna trigger box and the EtherReader which interfaces with a computer via Ethernet and wirelessly with an IceQube. The IceQube sensor is strapped to the leg of an animal for a period of a few weeks up to many years, during which time it gathers data of the movement of the animal. The IceQube does not transmit constantly. Transmission is activated via its 128 kHz inductor when the animal passes through the 128 Khz field produced by the antenna of the CowAlert System. Alternatively, or in addition, the IceQube can be programmed to transmit automatically at pre-defined time intervals.

There are three activation modes which result in three sets of transceiving frequencies within the 2400 MHz to 2483.5 MHz frequency band. “Double pulse” mode activates channels 8 (2402.6 MHz), 64 (2420.9 MHz), and 128 (2441.7 MHz). “Triple pulse” mode activates channels 50 (2416.3 MHz), 100 (2432.6 MHz), 150 (2448.9 MHz). “Timed download” mode activates channels 30 (2409.8 MHz), 200 (2465.2 MHz), 230 (2475.0 MHz). After activation the CowAlert system and the Ice Qube communicate with each other (transmit and receive) at 2.402-2.475 GHz for a few seconds while the data is downloaded, then the IceQube transmitter is turned off.

Testing was performed at the upper channel (2475 MHz), the middle channel (2441.7 MHz), and the lower channel (2402.6 MHz). Plots of the channels are shown in section 6.2.4.

This report covers the circuitry of the devices subject to FCC Part 15, Subpart C. The circuitry of the device subject to FCC Part 15, Subpart B has been tested and found to comply. See Nemko-CCL report #234767-2.

2.3 EUT and Support Equipment:

The EUT and support equipment used during the test are listed below:

Brand Name Model Number Serial No.	FCC ID Number	Description	Name of Interface Ports / Interface Cables
BN: IceRobotics MN: IceQube (Note 1)	WWP- ICEQUBE	Data logger and transmitter	See Section 2.4
BN: IceRobotics MN: CowAlert System	WWP- COWALERT	Transmitter activator and data downloader	Ethernet / Cat5E
BN: Samsung MN: N310	N/A	Laptop computer	Ethernet / Cat5E

Note: (1) EUT

2.4 Interface Ports on EUT:

Name of Port	No. of Ports Fitted to EUT	Cable Descriptions/Length
N/A	N/A	Wireless interface

2.5 Modification Incorporated/Special Accessories on EUT:

There were no modifications or special accessories required to comply with the specification.

SECTION 3.0 TEST SPECIFICATION, METHODS & PROCEDURES**3.1 Test Specification:**

Title: FCC PART 15, Subpart C (47 CFR 15)
15.203 and 15.249

Limits and methods of measurement of radio interference
characteristics of radio frequency devices

Purpose of Test: The tests were performed to demonstrate initial compliance

3.2 Methods & Procedures:**3.2.1 §15.203 Antenna Requirement**

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this Section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. This requirement does not apply to carrier current devices or to devices operated under the provisions of Sections 15.211, 15.213, 15.217, 15.219, or 15.221. Further, this requirement does not apply to intentional radiators that must be professionally installed, such as perimeter protection systems and some field disturbance sensors, or to other intentional radiators which, in accordance with Section 15.31(d), must be measured at the installation site. However, the installer shall be responsible for ensuring that the proper antenna is employed so that the limits in this Part are not exceeded.

3.2.2 §15.249 Operation within the bands 902 – 928 MHz, 2400 – 2483.5 MHz, and 5725 – 5850 MHz

- (a) Except as provided in paragraph (b) of this section, the field strength of emissions from intentional radiators operated within these frequency bands shall comply with the following:

Fundamental Frequency	Field Strength of Fundamental (millivolts/meter)	Field Strength of Harmonics (microvolts/meter)
902-928 MHz	50	500
2400-2483.5 MHz	50	500
5725-5875 MHz	50	500
24.0-24.25 GHz	250	2500

(b) Fixed, point-to-point operation as referred to in this paragraph shall be limited to systems employing a fixed transmitter transmitting to a fixed remote location. Point-to-multipoint systems, omnidirectional applications, and multiple co-located intentional radiators transmitting the same information are not allowed. Fixed, point-to-point operation is permitted in the 24.05-24.25 GHz band subject to the following conditions:

(1) The field strength of emissions in this band shall not exceed 2500 millivolts/meter.

(2) The frequency tolerance of the carrier signal shall be maintained within $\pm 0.001\%$ of the operating frequency over a temperature variation of -20 degrees to +50 degrees C at normal supply voltage, and for a variation in the primary supply voltage from 85% to 115% of the rated supply voltage at a temperature of 20 degrees C. For battery operated equipment, the equipment tests shall be performed using a new battery.

(3) Antenna gain must be at least 33 dBi. Alternatively, the main lobe beamwidth must not exceed 3.5 degrees. The beamwidth limit shall apply to both the azimuth and elevation planes. At antenna gains over 33 dBi or beamwidths narrower than 3.5 degrees, power must be reduced to ensure that the field strength does not exceed 2500 millivolts/meter.

(c) Field strength limits are specified at a distance of 3 meters.

(d) Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in § 15.209, whichever is the lesser attenuation.

(e) As shown in § 15.35(b), for frequencies above 1000 MHz, the field strength limits in paragraphs (a) and (b) of this section are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation. For point-to-point operation under paragraph (b) of this section, the peak field strength shall not exceed 2500 millivolts/meter at 3 meters along the antenna azimuth.

3.3 Test Procedure

The testing was performed according to the procedures in ANSI C63.4: 2003. Testing was performed at Nemko-CCL, Inc. Wanship open area test site #2, located at 29145 Old Lincoln Highway, Wanship, UT. This site has been registered with the FCC, and was renewed February 15, 2012 (90504). This registration is valid for three years.

Nemko-CCL, Inc. is accredited by National Voluntary Laboratory Accreditation Program (NVLAP); NVLAP Lab Code: 100272-0, which is effective until September 30, 2013.

SECTION 4.0 OPERATION OF EUT DURING TESTING

4.1 Operating Environment:

Power Supply: 3.6V Lithium-thionyl chloride (Li-SOCl₂) battery

4.2 Operating Modes:

The transmitter was tested while in a constant transmit mode at the desired frequency, using either the upper, middle, or lower channel. The EUT was tested on three orthogonal axis. The worst case was found with the EUT lying horizontally on the table. A new battery was used for testing.

4.3 EUT Exercise Software:

Internal IceRobotics firmware was used to exercise the transmitter.

SECTION 5.0 SUMMARY OF TEST RESULTS**5.1 FCC Part 15, Subpart C****5.1.1 Summary of Tests:**

Section	Environmental Phenomena	Frequency Range (MHz)	Result
15.203	Antenna Requirements	Structural requirement	Complied
15.249(a)	Field Strength of the Fundamental Frequency	2400 – 2483.5	Complied
15.249(a)	Field Strength of the Harmonics	2400 – 2483.5	Complied
15.249(d)	Field Strength of Spurious Emissions	0.009 – 24750.0	Complied

5.2 Result

In the configuration tested, the EUT complied with the requirements of the specification.

SECTION 6.0 MEASUREMENTS, EXAMINATIONS AND DERIVED RESULTS**6.1 General Comments:**

This section contains the test results only. A list of the test equipment used during the measurements can be found in Appendix 1 of this report.

6.2 Test Results:**6.2.1 §15.203 Antenna Requirements**

The EUT uses a trace antenna on the PCB that is not user replaceable.

6.2.2 §15.249(a) Fundamental Field Strength

The table below shows the low, middle and high fundamental emissions, measured at 3 meters using peak detection. The average measurement was obtained using an average factor of 10.4 dB. For details on the average factor calculation see Appendix 3.

Frequency (MHz)	Detector	Antenna Polarity	Receiver Reading (dBμV)	Correction Factor (dB/m)	Peak Field Strength (dBμV/m)	Average Field Strength (dBμV/m)	Peak Limit (dBμV/m)	Peak Margin (dB)	Average Limit (dBμV/m)	Average Margin (dB)
2402.6	Peak	V	63.7	31.8	95.5	85.1	114	-18.5	94	-8.9
2402.6	Peak	H	66.6	31.8	98.4	88.0	114	-15.6	94	-6.0
2441.7	Peak	V	63.4	31.9	95.3	84.9	114	-18.7	94	-9.1
2441.7	Peak	H	67.4	31.9	99.3	88.9	114	-14.7	94	-5.1
2475.0	Peak	V	62.3	32.0	94.3	83.9	114	-19.7	94	-10.1
2475.0	Peak	H	67.8	32.0	99.8	89.4	114	-14.2	94	-4.6

RESULT

The EUT complied with the specification by 4.6 dB.

6.2.3 §15.249(a) and §15.249(d) Field Strength of Harmonics and Spurious Emissions

The spurious emissions and harmonic emissions were measured from 0.009 MHz to 24750.0 MHz on the low, middle, and high channels. The tables below show the emissions from the transmitter. Emissions from the digital circuitry and receivers of the EUT are shown in Nemko-CCL report 234767-2.1. The average measurement was obtained using an average factor of 10.4 dB. For details on the average factor calculation see Appendix 3. Measurements above 18 GHz were made at a 1 meter measurement distance, with the noise floor at least 6 dB below the limit. For harmonics and spurious emissions, measurements are shown to the degree beyond which only noise floor was seen.

6.2.3.1 Lowest Channel Harmonics and Spurious Emissions

Frequency (MHz)	Detection Mode	Antenna Polarity	Receiver Reading (dBμV)	Correction Factor (dB)	Peak Field Strength (dBμV/m)	Average Field Strength (dBμV/m)	Peak Limit (dBμV/m)	Peak Margin (dB)	Average Limit (dBμV/m)	Average Margin (dB)
4805.2	Peak	V	52.6	37.6	58.6	48.2	74.0	-15.4	54.0	-5.8
4805.2	Peak	H	51.7	37.6	57.7	47.3	74.0	-16.3	54.0	-6.7
7207.8	Peak	V	40.3	41.7	51.6	41.2	74.0	-22.4	54.0	-12.8
7207.8	Peak	H	37.3	41.7	48.6	38.2	74.0	-25.4	54.0	-15.8

RESULT

The EUT complied with the specification on this channel by 5.8 dB.

6.2.3.2 Middle Channel Harmonics and Spurious Emissions

Frequency (MHz)	Detection Mode	Antenna Polarity	Receiver Reading (dBμV)	Correction Factor (dB)	Peak Field Strength (dBμV/m)	Average Field Strength (dBμV/m)	Peak Limit (dBμV/m)	Peak Margin (dB)	Average Limit (dBμV/m)	Average Margin (dB)
4883.4	Peak	V	51.8	37.8	57.9	47.5	74.0	-16.1	54.0	-6.5
4883.4	Peak	H	49.1	37.8	55.2	43.8	74.0	-18.8	54.0	-9.2
7325.1	Peak	V	36.8	42.1	48.4	38.0	74.0	-25.6	54.0	-16.0
7325.1	Peak	H	34.6	42.1	46.2	35.8	74.0	-27.8	54.0	-18.2

RESULT

The EUT complied with the specification on this channel by 6.5 dB.

6.2.3.3 Highest Channel Harmonics and Spurious Emissions

Frequency (MHz)	Detection Mode	Antenna Polarity	Receiver Reading (dBμV)	Correction Factor (dB)	Peak Field Strength (dBμV/m)	Average Field Strength (dBμV/m)	Peak Limit (dBμV/m)	Peak Margin (dB)	Average Limit (dBμV/m)	Average Margin (dB)
4950	Peak	V	52.2	37.9	58.4	48.0	74.0	-15.6	54.0	-6.0
4950	Peak	H	49.6	37.9	55.8	45.4	74.0	-18.2	54.0	-8.6
7425	Peak	V	37.0	42.4	48.9	38.5	74.0	-25.1	54.0	-15.5
7425	Peak	H	35.8	42.4	47.7	37.3	74.0	-26.3	54.0	-16.7

RESULT

The EUT complied with the specification on this channel by 6.0 dB.

6.2.4 Channel Bandwidth and Band Edge

The 20 dB bandwidths of the lower, middle, and upper channels are shown in the plots below. These plots show that the fundamental emissions have a 20 dB band width of ~1.3 MHz and are contained completely within the 2400 – 2483.5 MHz frequency band.

Mkr	X-Axis	Value	Notes

APPENDIX 1 TEST PROCEDURES AND TEST EQUIPMENT**A1.1 §15.249 Radiated Measurements**

The radiated emissions from the intentional radiator were measured using a spectrum analyzer with a quasi-peak adapter for peak and quasi-peak readings.

A loop antenna was used to measure emissions below 30 MHz. Emission readings more than 20 dB below the limit at any frequency may not be listed in the reported data. For frequencies between 9 kHz and 30 MHz, or the lowest frequency generated or used in the device greater than 9 kHz, and less than 30 MHz, the spectrum analyzer resolution bandwidth was set to 9 kHz and the video bandwidth was set to 30 kHz. For average measurements, the spectrum analyzer average detector was used.

For frequencies above 30 MHz, an amplifier and preamplifier were used to increase the sensitivity of the measuring instrumentation. The quasi-peak adapter uses a bandwidth of 120 kHz, with the spectrum analyzer's resolution bandwidth set at 1 MHz, for readings in the 30 to 1000 MHz frequency ranges. For peak emissions above 1000 MHz the spectrum analyzer's resolution bandwidth was set to 1 MHz and the video bandwidth was set to 3 MHz. For average measurements above 1000 MHz the spectrum analyzer's resolution bandwidth was set to 1 MHz and the average detector of the analyzer was used.

A biconilog antenna was used to measure the frequency range of 30 to 1000 MHz and a Double Ridge Guide Horn antenna was used to measure the frequency range of 1 GHz to 18 GHz at a distance of 3 meters and/or 1 meter from the EUT. The readings obtained by the antenna are correlated to the levels obtained with a tuned dipole antenna by adding antenna factors.

The configuration of the EUT was varied to find the maximum radiated emission. The EUT was connected to the peripherals listed in Section 2.3 via the interconnecting cables listed in Section 2.4. A technician manually manipulated these interconnecting cables to obtain worst-case radiated disturbance. The EUT was rotated 360 degrees, and the antenna height was varied from 1 to 4 meters to find the maximum radiated emission. Where there were multiple interface ports all of the same type, cables are either placed on all of the ports or cables added to these ports until the emissions do not increase by more than 2 dB.

Desktop EUT are measured on a non-conducting table 0.8 meters above the ground plane. The table is placed on a turntable, which is level with the ground plane. For equipment normally placed on floors, the equipment shall be placed directly on the turntable.

For radiated emission testing at 30 MHz or above that is performed at distances closer than the specified distance, an inverse proportionality factor of 20 dB per decade is used to normalize the measured data for determining compliance.

APPENDIX 3 Average Factor Calculation

The average factor is calculated by taking the average over the 100 millisecond period over which the average is greatest, as specified in §15.35(C). The pulse widths and pulse period needed to make the average factor and duty calculations are shown in the graphs below.

Pulse Period: 177.2 ms

Total On Time for Pulse Period:

$$9 \text{ pulses} \times 2.9808 \text{ ms} + 2 \times 2.2115 \text{ ms} + 1.1218 \text{ ms} = 32.37 \text{ ms}$$

Duty Cycle (using the full pulse width shown below):

$$32.37 \text{ ms} / 177.2 \text{ ms} = 18\%$$

Mkr	X-Axis	Value	Notes
1 ▾	10.5769 ms	53.43 dBuV	
2-1 ▾	177.2436 ms	0.27 dB	

Pulse Period 200 ms plot

Total On Time for Worst 100 ms:

$$9 \text{ pulses} \times 2.9808 \text{ ms} + 2.2115 \text{ ms} + 1.1218 \text{ ms} = 30.16 \text{ ms}$$

Average Factor (using the worst case 100 ms period shown below):

$$20 \log (30.16 \text{ ms} / 100 \text{ ms}) = -10.41 \text{ dB}$$

Mkr	X-Axis	Value	Notes
1 ▽	32.0513 us	53.99 dBuV
