### Remark:

N/A: not applicable. Refer to the relative section for the details. EUT: In this whole report EUT means Equipment Under Test.

Tx: In this whole report Tx (or tx) means Transmitter.

Rx: In this whole report <math>Rx (or rx) means Receiver.

RF: In this whole report RF means Radio Frequency.

ANSI C63.10: the detail version is ANSI C63.10:2009 in the whole report.

DA 00-705: "Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems"

### 5 General Information

### 5.1 Client Information

Applicant: Winchance Solar(Fujian) Technology Co., Ltd.

Address of Applicant: Jiangnan New Hi-Tech Electronic Industrial Park, Quanzhou, Fujian,

China

### 5.2 General Description of E.U.T.

Product Name: USB dongle

Product Description: USB bluetooth transmitters

Model No.: MU-608

### 5.3 Details of E.U.T.

Operating Frequency 2402 MHz to 2480 MHz

Type of Modulation: GFSK, (π/4)DQPSK, 8DPSK

Number of Channels 79 Channels

Channel Separation: 1 MHz

Dwell time Per channel is less than 0.4s.

Antenna Type Integral
Antenna gain: 0 dBi

Speciality: Bluetooth 2.1with EDR

Function: USB dongle with BT function to transmit and receive audio signal.

Power Supply: Power supply from the computer

Report No.: GZEM110500139303

Page: 6 of 70

FCC ID: WYNWINCHANCE-608

### 5.4 Modulation configure

| Modulation | Packet | Packet Type | Packet Size |
|------------|--------|-------------|-------------|
|            | DH1    | 4           | 24          |
| GFSK       | DH3    | 11          | 183         |
|            | DH5    | 15          | 339         |
|            | 2DH1   | 20          | 54          |
| (π/4)DQPSK | 2DH3   | 26          | 367         |
|            | 2DH5   | 30          | 379         |
|            | 3DH1   | 24          | 83          |
| 8DPSK      | 3DH3   | 27          | 552         |
|            | 3DH5   | 31          | 1021        |

#### Remark:

### **Modulation 8-DPSK**

The modulation 8 PSK works with 8 phases between 0 and 2\*pi (0 and 360 degrees), it can be seeing bellow in the circle.

Normal mode: the Bluetooth has been tested on the Modulation of GFSK;

EDR mode: the Bluetooth has been tested on the Modulation of  $(\pi/4)$ DQPSK and 8DPSK, compliance test and record the worst case on 8DPSK.

Report No.: GZEM110500139303

Page: 7 of 70

FCC ID: WYNWINCHANCE-608

### 5.5 Description of Support Units

The EUT has been tested with associated equipment as a typical PC system.

FCC ID: WYNWINCHANCE-608

### 5.6 Deviation from Standards

Biconical and log periodic antennas were used instead of dipole antennas.

### 5.7 Abnormalities from Standard Conditions

None.

### 5.8 Other Information Requested by the Customer

None.

### 5.9 Test Location

All tests were performed at:

SGS-CSTC Standards Technical Services Co., Ltd., Guangzhou EMC Laboratory, 198 Kezhu Road, Scientech Park, Guangzhou Economic & Technology Development District, Guangzhou, China 510663

Tel: +86 20 82155555 Fax: +86 20 82075059

No tests were sub-contracted.

Report No.: GZEM110500139303

Page: 10 of 70

FCC ID: WYNWINCHANCE-608

### 5.10 Test Facility

The test facility is recognized, certified, or accredited by the following organizations:

#### NVLAP (Lab Code: 200611-0)

SGS-CSTC Standards Technical Services Co., Ltd., Guangzhou EMC Laboratory is recognized under the National Voluntary Laboratory Accreditation Program (NVLAP/NIST). NVLAP Code: 200611-0.

#### ACMA

SGS-CSTC Standards Technical Services Co., Ltd., EMC Laboratory can also perform testing for the Australian C-Tick mark as a result of our NVLAP accreditation.

### SGS UK(Certificate No.: 32), SGS-TUV SAARLAND and SGS-FIMKO

Have approved SGS-CSTC Standards Technical Services Co., Ltd., EMC Laboratory as a supplier of EMC TESTING SERVICES and SAFETY TESTING SERVICES.

### CNAS (Lab Code: L0167)

SGS-CSTC Standards Technical Services Co., Ltd., EMC Laboratory has been assessed and in compliance with CNAS-CL01:2006 accreditation criteria for testing laboratories (identical to ISO/IEC 17025:2005 General Requirements) for the Competence of Testing Laboratories.

#### • FCC (Registration No.: 282399)

SGS-CSTC Standards Technical Services Co., Ltd., EMC Laboratory has been registered and fully described in a report filed with the (FCC) Federal Communications Commission. The acceptance letter from the FCC is maintained in our files. Registration 282399, May 31, 2002.

#### Industry Canada (Registration No.: 4620B-1)

The 3m/10m Alternate Semi-anechoic chamber of SGS-CSTC Standards Technical Services Co., Ltd. has been registered by Certification and Engineering of Industry Canada for radio equipment testing with Registration No. 4620B-1.

Date of Registration: February 18, 2009. Valid until February 18, 2011.

### VCCI (Registration No.: R-2460 and C-2584)

The 10m Semi-anechoic chamber and Shielded Room of SGS-CSTC Standards Technical Services Co., Ltd. have been registered in accordance with the Regulations for Voluntary Control Measures with Registration No.: R-2460 and C-2584 respectively.

### • CBTL (Lab Code: TL129)

SGS-CSTC Standards Technical Services Co., Ltd., E&E Laboratory has been assessed and fully comply with the requirements of ISO/IEC 17025:2005, the Basic Rules, IECEE 01:2006-10 and Rules of procedure IECEE 02:2006-10, and the relevant IECEE CB-Scheme Operational documents. This certificate was issued August 6, 2009 and valid until May 19, 2012.

Report No.: GZEM110500139303

### 7 Test Results

### 7.1 E.U.T. test conditions

Power supply: AC 120V

**Temperature:** 20.0 -25.0 °C **Humidity:** 38-50 % RH

Atmospheric Pressure: 1000 -1010 mbar

Test frequencies and

frequency range:

According to the 15.31(m) Measurements on intentional radiators or receivers, other than TV broadcast receivers, shall be performed and, if required, reported for each band in which the device can be operated with the device operating at the number of frequencies in each band specified in the following table:

According to the 15.33 (a) For an intentional radiator, the spectrum shall be investigated from the lowest radio frequency signal generated in the device, without going below 9 kHz, up to at least the frequency

shown in the following table:

### Number of fundamental frequencies to be tested in EUT transmit band

| Frequency range in which device operates | Number of frequencies | Location in frequency range of operation |
|--|-----------------------|--|
| 1 MHz or less                            | 1                     | Middle                                   |
| 1 MHz to 10 MHz                          | 2                     | 1 near top and 1 near bottom             |
| More than 10 MHz                         | 3                     | 1 near top, 1 near middle and 1          |
| Widte that 10 MHz                        | 3                     | near bottom                              |

### Frequency range of radiated emission measurements

| Lowest frequency generated in the device | Upper frequency range of measurement                         |
|--|--|
| 9 kHz to below 10 GHz                    | 10th harmonic of highest fundamental frequency or to 40 GHz, |
|  | whichever is lower   |
| At or above 10 GHz to below              | 5th harmonic of highest fundamental frequency or to 100 GHz, |
| 30 GHz                                   | whichever is lower   |
| At or above 30 GHz                       | 5th harmonic of highest fundamental frequency or to 200 GHz, |
|  | whichever is lower, unless otherwise specified               |

### 7.2 Antenna Requirement

### Standard requirement

15.203 requirement:

For intentional device. According to 15.203. an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device.

15.247(c) (1)(i) requirement:

(i) Systems operating in the 2400-2483.5 MHz bands that are used exclusively for fixed. Point-to-point operations may employ transmitting antennas with directional gain greater than 6 dBi provided the maximum conducted output power of the intentional radiator is reduced by 1 dB for every 3 dB that the directional gain of the antenna exceeds 6 dBi.

### **EUT Antenna**

The antenna is integrated on the main PCB and no consideration of replacement. The best case gain of the antenna is 0 dBi.

Test result: The unit does meet the FCC requirements.

Report No.: GZEM110500139303

Page: 16 of 70

FCC ID: WYNWINCHANCE-608

### 7.3 Occupied Bandwidth

**Test Requirement:** FCC Part 15 C section 15.247

(a)(1) Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater

than 125 mW.

**Test Method:** ANSI C63.10: Clause 6.9 & DA 00-705

**Test Status:** Pre-test the EUT in continuous transmitting mode at the lowest (2402

MHz), middle (2441 MHz) and highest (2480 MHz) channel with different data package. Compliance test in normal mode (DH5) and EDR mode

(3DH5) as the worst case was found.

### **Test Configuration:**

**Ground Reference Plane** 

#### **Test Procedure:**

- 1. Remove the antenna from the EUT and then connect a low RF cable from the antenna port to the spectrum;
- 2. Set the spectrum analyzer: Span = approximately 2 to 3 times the 20 dB bandwidth, centring on a hopping channel;
- 3. Set the spectrum analyzer: RBW >= 1% of the 20dB bandwidth VBW >= RBW. Sweep = auto; Detector Function = Peak. Trace = Max Hold.
- 4. Mark the peak frequency and -20 dB points bandwidth.

Report No.: GZEM110500139303

Page: 17 of 70

FCC ID: WYNWINCHANCE-608

### Test result:

#### Normal mode:

| Test Channel | Bandwidth(MHz) | 2/3 bandwidth(MHz) |
|--------------|----------------|--------------------|
| Lowest       | 1.152          | 0.768              |
| Middle       | 1.142          | 0.762              |
| Highest      | 1.132          | 0.755              |

#### EDR mode:

| Test Channel | bandwidth | 2/3 bandwidth |
|--------------|-----------|---------------|
| Lowest       | 1.393     | 0.929         |
| Middle       | 1.403     | 0.935         |
| Highest      | 1.413     | 0.942         |

### 7.4 Carrier Frequencies Separated

**Test Requirement:** FCC Part 15 C section 15.247

(a),(1) Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

Test Method: DA 00-705

**Test Status:** Pre-test the EUT in continuous transmitting mode at the lowest (2402 MHz),

middle (2441 MHz) and highest (2480 MHz) channel and hopping mode with different data packet. Compliance test in hopping with EDR mode (3DH5) as

the worst case was found.

### **Test Configuration:**

**Ground Reference Plane** 

#### **Test Procedure:**

- 1. Remove the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
- 2. Set the spectrum analyzer: RBW >= 1% of the span, VBW >= RBW,. Sweep = auto; Detector Function = Peak. Trace = Max, hold.
- 3. Allow the trace to stabilize. Use the marker-delta function to determine the separation between the peaks of the adjacent channels. The limit is specified in one of the subparagraphs of this Section. Submit this plot.

Report No.: GZEM110500139303

Page: 22 of 70

### 7.5 Hopping Channel Number

**Test Requirement:** FCC Part15 C section 15.247

(a)(1)(iii) Frequency hopping systems in the 2400-2483.5 MHz band shall use

at least 15 channels.

Test Method: DA 00-705

Test Status: Pre-test the EUT in hopping mode with different data packet. Compliance test

in hopping with EDR mode (3DH5) as the worst case was found.

### **Test Configuration:**

#### **Test Procedure:**

- 1. Remove the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
- 2. Set the spectrum analyzer: RBW = 100 kHz. VBW = 100 kHz. Sweep = auto; Detector Function = Peak. Trace = Max hold.
- Allow the trace to stabilize. It may prove necessary to break the span up to sections. in order to clearly show all of the hopping frequencies. The limit is specified in one of the subparagraphs of this Section.
- 4. Set the spectrum analyzer: start frequency = 2400 MHz. stop frequency = 2483.5 MHz. Submit the test result graph.

Report No.: GZEM110500139303

Page: 26 of 70

FCC ID: WYNWINCHANCE-608

Test result: Total channels are 79 channels.

Test result: The unit does meet the FCC requirements.

Report No.: GZEM110500139303

Page: 27 of 70

FCC ID: WYNWINCHANCE-608

### 7.6 Dwell Time

Test Requirement: FCC Part 15 C section 15.247

(a)(1)(iii) Frequency hopping systems in the 2400-2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping

frequency provided that a minimum of 15 channels are used.

Test Method: DA 00-705

**Test Status:** Pre-test the EUT in continuous transmitting mode at the lowest (2402 MHz),

middle (2441 MHz) and highest (2480 MHz) channel with different data packet. Compliance test in hopping with EDR mode (3DH1, 3DH3 and

3DH5) as the worst case was found.

### **Test Configuration:**

Ground Reference Plane

#### **Test Procedure:**

- 1.Remove the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
- 2. Set spectrum analyzer span = 0. centered on a hopping channel;
- 3.Set RBW = 1 MHz and VBW = 1 MHz.Sweep = as necessary to capture the entire dwell time per hopping channel. Detector Function = Peak. Trace = Max hold;
- 4.Use the marker-delta function to determine the dwell time. If this value varies with different modes of operation (e.g., data rate, modulation format, etc.). Repeat this test for each variation. The limit is specified in one of the subparagraphs of this Section. Submit this plot(s). An oscilloscope may be used instead of a spectrum analyzer.

Report No.: GZEM110500139303

Page: 28 of 70

FCC ID: WYNWINCHANCE-608

### **Test Result:**

The test period: T= 0.4 Second/Channel x 79 Channel = 31.6 s

1. **Channel 0:** 2.402GHz

3DH1 time slot = 0.401 (ms) \* (1600/(2\*79)) \* 31.6 = 128.320ms 3DH3 time slot = 1.673 (ms) \* (1600/(4\*79)) \* 31.6 = 267.680ms

3DH5 time slot = 2.922 (ms) \* (1600/(6\*79)) \* 31.6 = 311.680 ms

2. Channel 39: 2.41GHz

3DH1 time slot = 0.411 (ms) \* (1600/(2\*79)) \* 31.6 = 131.520 ms

3DH3 time slot = 1.673 (ms) \* (1600/(4\*79)) \* 31.6 = 267.680ms

3DH5 time slot = 2.922 (ms) \* (1600/(6\*79)) \* 31.6 = 311.608 ms

3. Channel 78: 2.480GHz

3DH1 time slot = 0.411 (ms) \* (1600/(2\*79)) \* 31.6 = 131.520 ms

3DH3 time slot = 1.663 (ms) \* (1600/(4\*79)) \* 31.6 = 266.080ms

3DH5 time slot = 2.922 (ms) \* (1600/(6\*79)) \* 31.6 = 311.608 ms

The results are not greater than 0.4 seconds.

The unit does meet the FCC requirements.

### (3) 3DH5

#### Remark:

In communication data link mode (expect inquiry or page mode) the hopping rate is 1600 per second, the 79 channels will be randomly selected for RF channel, and each channel have equal probability to be selected. The hop selection scheme is defined in Clause 2.6 of Part B of Volume 2 of core specification of Bluetooth.

The Dwell time must be calculated via following formula:

Dwell time = Pulse wide x (Hopping rate / Number of channels) x Period

Period = 0.4 (seconds/ channel) x 79 (channel) = 31.6 seconds

So

Dwell time DH1= slot time \* (1600/2/79) \* 31.6

Dwell time DH3= slot time \* (1600/4/79) \* 31.6

Dwell time DH5= slot time \* (1600/6/79) \* 31.6

The RF channel will remain fixed for duration of a packet, that means for DH3 packet the RF frequency will remain unchanged during 3 slots (1slot=1/1600=625us), and for DH5 packet the RF frequency will remain unchanged during 5 slots, illustrated the principle as below:

Report No.: GZEM110500139303

Page: 34 of 70

FCC ID: WYNWINCHANCE-608

Figure 2.14: Single- and multi-slot packets.

Therefore, in a certain period for different packet types, the quantities of hops (not hopping rate 1600) are different, accurately, the quantity of hops for DH1 is double of DH3's and triple of DH5's. "for DH1 packet, 1 hop in 1 slot; for DH3 packet, ½ hop in 1 slot; for DH5 packet, 1/3 hop in 1 slot.", explained as below:

From the illustrated hopping scheme:

For DH1, in two slots, there are two hops, i.e. f(k) in Slot(k), f(k+1) in Slot(k+1), means DH1 1 hop in 1 slot;

For DH3, in four slots, there are two hops, i.e. f(k) in Slot(k) & Slot(k+1) & Slot(k+2), f(k+3) in Slot(k+3), means DH3 2 hops in four slots ->  $\frac{1}{2}$  hop in 1 slot;

For DH5, in six slots, there are two hops, i.e. f(k) in Slot(k) & Slot(k+1) & Slot(k+2) & Slot(k+3) & Slot(k+4), f(k+5) in Slot(k+5), means DH3 2 hops in six slots -> 1/3 hop in 1 slot.

The Hopping rate in the formula should not be fixed value, for DH1, it is 1600/2; for DH3, it is 1600/4; for DH5, it is 1600/6.

To calculate Dwell time of data transmission of Bluetooth system, the worst case is for Bluetooth PICONET that contains two devices only (although Bluetooth PICONET can support up to eight devices), and for Bluetooth data transmission, after device A sending a packet to device B, device A must get response packet from device B to continue data transmission;

For DH1 packet: assume device A is EUT, the worst case is after device A sending a DH1 packet to device B, device A gets a DH1 response packet from device B, that means device A needs 1 time slot for transmitting and 1 time slot for receiving, therefore, the actual hopping rate of device A is half of 1600, i.e. 800 hops per second for EUT;

Report No.: GZEM110500139303

Page: 35 of 70

FCC ID: WYNWINCHANCE-608

For DH3 packet: assume device A is EUT, the worst case is after device A sending a DH3 packet to device B, device A gets a DH1 response packet from device B, that means device A needs 3 time slots for transmitting and 1 time slot for receiving, therefore, the actual hopping rate of device A is quarter of 1600, i.e. 400 hops per second for EUT;

For DH5 packet: assume device A is EUT, the worst case is after device A sending a DH5 packet to device B, device A gets a DH1 response packet from device B, that means device A needs 5 time slots for transmitting and 1 time slot for receiving, therefore, the actual hopping rate of device A is sixth of 1600, i.e. 1600/6=266.7 hops per second for EUT;

Report No.: GZEM110500139303

Page: 36 of 70

FCC ID: WYNWINCHANCE-608

### 7.7 Pseudorandom Frequency Hopping Sequence

### 7.7.1 Standard requirement

15.247(a)(1) requirement:

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.

Alternatively. Frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a Pseudorandom ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

Report No.: GZEM110500139303

Page: 37 of 70

FCC ID: WYNWINCHANCE-608

### 7.7.2 EUT Pseudorandom Frequency Hopping Sequence

The pseudorandom sequence may be generated in a nine-stage shift register whose 5th and 9<sup>th</sup> stage outputs are added in a modulo-two addition stage. And the result is fed back to the input of the first stage. The sequence begins with the first ONE of 9 consecutive ONEs; i.e. the shift register is initialized with nine ones.

- · Number of shift register stages: 9
- Length of pseudo-random sequence: 29 -1 = 511 bits
- Longest sequence of zeros: 8 (non-inverted signal)

Linear Feedback Shift Register for Generation of the PRBS sequence

An example of Pseudorandom Frequency Hopping Sequence as follow:

Each frequency used equally on the average by each transmitter.

The system receivers have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shift frequencies in synchronization with the transmitted signals.

Report No.: GZEM110500139303

### 7.8 Maximum Peak Output Power

Test Requirement: FCC Part 15 C section 15.247

(b)(1)For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1 watt. For all other frequency hopping systems in the 2400-2483.5 MHz band:

0.125 watts.

Refer to the result "Hopping channel number" of this document. The 1

watt (30.0 dBm) limit applies.

**Test Method:** ANSI C63.10: Clause 6.10 & DA 00-705

**Test Limit:** 

Test mode: Pre-test the EUT in continuous transmitting mode at the lowest (2402

MHz), middle (2441 MHz) and highest (2480 MHz) channel with different data packet. Compliance test in continuous transmitting mode with normal (DH5) and EDR mode (3DH5) as the worst case was

found.

### **Test Configuration:**

Ground Reference Plane

### **Test Procedure:**

- 1. Remove the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
- 2. Set the spectrum analyzer: RBW = 2 MHz. VBW = 2 MHz. Sweep = auto; Detector Function = Peak.
- 3. Keep the EUT in transmitting at lowest, medium and highest channel individually. Record the max value.

### 7.9 Conducted Spurious Emissions

**Test Requirement:** FCC Part15 C section 15.247

(d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating. The radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. Based on either an RF conducted or a radiated measurement. Provided the transmitter demonstrates compliance with the peak conducted power limits.

**Test Method:** ANSI C63.10: Clause 6.7 & DA 00-705

**Test Status:** Pre-test the EUT in continuous transmitting mode at the lowest (2402

MHz), middle (2441 MHz) and highest (2480 MHz) channel with different data packet. Compliance test in continuous transmitting mode with normal

mode (DH5) as the worst case was found.

### **Test Configuration:**

Ground Reference Plane

#### **Test Procedure:**

- 1. Remove the antenna from the EUT and then connect a low attenuation RF cable from the antenna port to the spectrum.
- 2. Set the spectrum analyzer: RBW = 100 kHz. VBW >= RBW. Sweep = auto; Detector Function = Peak (Max. hold).

### 7.10 Radiated Spurious Emissions

**Test Requirement:** FCC Part15 C section 15.247

(d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating. The radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that Contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, and provided the transmitter demonstrates compliance with the peak conducted power limits.

**Test Method:** ANSI C63.10: Clause 6.4, 6.5 and 6.6 & DA 00-705

**Test Status:** Pre-test the EUT in continuous transmitting mode at the lowest (2402

MHz), middle (2441 MHz) and highest (2480 MHz) channel with different data packet. Compliance test in continuous transmitting mode with normal

mode (DH5) as the worst case was found.

**Detector:** For PK value:

RBW = 1 MHz for  $f \ge 1$  GHz, 100 kHz for f < 1 GHz

VBW ≥ RBW Sweep = auto

Detector function = peak

Trace = max hold For AV value:

RBW = 1 MHz for  $f \ge 1$  GHz, 100 kHz for f < 1 GHz

VBW =10 Hz Sweep = auto

Detector function = peak

Trace = max hold

15.209 Limit:  $40.0 \text{ dB}\mu\text{V/m}$  between 30MHz & 88MHz

 $43.5~dB\mu V/m$  between 88MHz~&~216MHz  $46.0~dB\mu V/m$  between 216MHz~&~960MHz

 $54.0 \text{ dB}\mu\text{V/m}$  above 960MHz

Report No.: GZEM110500139303

Page: 50 of 70

FCC ID: WYNWINCHANCE-608

### **Test Configuration:**

1) 30 MHz to 1 GHz emissions:

2) 1 GHz to 40 GHz emissions:

Report No.: GZEM110500139303

Page: 51 of 70

FCC ID: WYNWINCHANCE-608

**Test Procedure:** The procedure used was ANSI Standard C63.10:2009. The receiver was scanned from 30MHz to 25GHz. When an emission was found, the table was rotated to produce the maximum signal strength. An initial pre-scan was performed for in peak detection mode using the receiver. The EUT was measured for both the Horizontal and Vertical polarities and performed a pre-test three orthogonal planes. For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. The worst case emissions were reported.

Now set the VBW to 10 Hz, while maintaining all of the other instrument settings. This peak level, once corrected, must comply with the limit specified in Section 15.209. If the dwell time per channel of the hopping signal is less than 100 ms, then the reading obtained with the 10 Hz VBW may be further adjusted by a "duty cycle correction factor", derived from 20log(dwell time/100 ms), in an effort to demonstrate compliance with the 15.209 limit.

Submit this data.

Y: rotate EUT by 90° vertically.

X: rotate EUT by 90° clockwise.

Z: EUT as Radiated Emission test setup photograph in section 8 of this report.

Remark: Radiated Emission test setup photograph in section 8 of this report is the worst case and reported.

### Remark:

1). The field strength is calculated by adding the Antenna Factor. Cable Factor & Preamplifier. The basic equation with a sample calculation is as follows:

Final Test Level = Receiver Reading + Antenna Factor + Cable Loss - Preamplifier Factor.

- 2). As shown in Section, for frequencies above 1000 MHz. the above field strength limits are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation.
- 3). The test only perform the EUT in transmitting status since the test frequencies were over 1GHz only required transmitting status.

Test result: The unit does meet the FCC requirements.

Report No.: GZEM110500139303

Page: 61 of 70

FCC ID: WYNWINCHANCE-608

### 7.10.2 Radiated Emissions which fall in the restricted bands

**Test Requirement:** FCC Part15 C Section 15.247

(d) In addition, radiated emissions which fall in the restricted bands. as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).

**Test Method:** ANSI C63.10: Clause 6.4, 6.5 and 6.6 & DA 00-705

**Test Status:** Pre-test the EUT in continuous transmitting mode at the lowest (2402

MHz), middle (2441 MHz) and highest (2480 MHz) channel with different

data packet. Compliance test in continuous transmitting mode with

normal mode (DH5) as the worst case was found.

Measurement Distance: 3m (Semi-Anechoic Chamber)

Limit: Section 15.209(a)

 $40.0 \text{ dB}\mu\text{V/m}$  between 30MHz & 88MHz;

 $43.5 \text{ dB}\mu\text{V/m}$  between 88MHz & 216MHz;

46.0 dBµV/m between 216MHz & 960MHz;

 $54.0 \text{ dB}\mu\text{V/m}$  above 960MHz.

**Detector:** For PK value:

RBW = 1 MHz for  $f \ge 1$  GHz, 100 kHz for f < 1 GHz

VBW ≥ RBW Sweep = auto

Detector function = peak

Trace = max hold For AV value:

RBW = 1 MHz for  $f \ge 1$  GHz, 100 kHz for f < 1 GHz

VBW =10 Hz Sweep = auto

Detector function = peak

Trace = max hold

Report No.: GZEM110500139303

### 7.11 Band Edges Requirement

Test Requirement: FCC Part15 C section 15.247

(d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in Section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section

15.205(c)).

Frequency Band: 2400 MHz to 2483.5 MHz

**Test Method:** ANSI C63.10: Clause 6.9 & DA 00-705

**Test Status:** Pre-test the EUT in continuous transmitting mode at the lowest (2402 MHz),

and highest (2480 MHz) channel and hopping mode with different data packet. Compliance test in continuous transmitting mode with normal (DH5)

and EDR mode (3DH5) as the worst case was found.

#### **Test Configuration:**

**Ground Reference Plane** 

**Test Procedure:** Set RBW of spectrum analyzer to 100 kHz and VBW of spectrum analyzer

to 100 kHz with suitable frequency span including 100 kHz bandwidth from

band edge.

The band edges was measured and recorded Result:

The Lower Edges attenuated more than 20dB.

The Upper Edges attenuated more than 20dB.

The graph as below. Represents the emissions take for this device.

### 7.12 Conducted Emissions at Mains Terminals 150 kHz to 30 MHz

Test Requirement: FCC Part 15 C section 15.207

**Test Method:** ANSI C63.10: Clause 6.2 & DA 00-705

Frequency Range: 150 kHz to 30 MHz

**Detector:** Peak for pre-scan (9 kHz Resolution Bandwidth)

**Test Limit** 

### Limits for conducted disturbance at the mains ports of class B

| Frequency Range | Class B Limit dB(μV) |          |  |  |  |
|-----------------|----------------------|----------|--|--|--|
| (MHz)           | Quasi-peak           | Average  |  |  |  |
| 0.15 to 0.50    | 66 to 56             | 56 to 46 |  |  |  |
| 0.50 to 5       | 56                   | 46       |  |  |  |
| 5 to 30         | 60                   | 50       |  |  |  |

NOTE 1 The limit decreases linearly with the logarithm of the frequency in the range 0,15 MHz to 0,50 MHz.

**EUT Operation:** 

Test in normal operating mode. For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage.

Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates and antenna ports (if EUT with antenna diversity architecture).

Report No.: GZEM110500139303

Page: 68 of 70

FCC ID: WYNWINCHANCE-608

### **Test Configuration:**

### Test procedure:

- 1. The mains terminal disturbance voltage test was conducted in a shielded room.
- 2. The EUT was connected to AC power source through a LISN 1 (Line Impedance Stabilization Network) which provides a  $50\Omega/50\mu H + 5\Omega$  linear impedance. The power cables of all other units of the EUT were connected to a second LISN 2, which was bonded to the ground reference plane in the same way as the LISN 1 for the unit being measured. A multiple socket outlet strip was used to connect multiple power cables to a single LISN provided the rating of the LISN was not exceeded.
- 3. The tabletop EUT was placed upon a non-metallic table 0.8m above the ground reference plane. And for floor-standing arrangement, the EUT was placed on the horizontal ground reference plane, but separated from metallic contact with the ground reference plane by 0.1m of insulation.
- 4. The test was performed with a vertical ground reference plane. The rear of the EUT shall be 0,4 m from the vertical ground reference plane. The vertical ground reference plane was bonded to the horizontal ground reference plane. The LISN 1 was placed 0,8 m from the boundary of the unit under test and bonded to a ground reference plane for LISNs mounted on top of the ground reference plane. This distance was between the closest points of the LISN 1 and the EUT. All other units of the EUT and associated equipment was at least 0,8 m from the LISN 2.

### 7.12.1 Measurement Data

An initial pre-scan was performed on the live and neutral lines with peak detector.

Quasi-Peak and Average measurement were performed at the frequencies with maximized peak emission were detected. For EUT the communicating was worst case mode.

### The following Quasi-Peak and Average measurements were performed on the EUT:

Neutral Line

Level(dB  $\mu$  V)

### Measure data:

| Freq   | Read<br>Level  |  | LISN<br>Factor |   |  | Over<br>Limit  | Remark  |
