## 2.1 Technical Characteristic Test

### 2.1.1 6dB Bandwidth - 15.247(a)

#### Procedure:

The bandwidth at 6dB below the highest in-band spectral density was measured with a spectrum analyzer connected to the antenna terminal, while EUT is operating in transmission mode at the appropriate frequencies.

After the trace being stable, Use the marker-to-peak function to set the marker to the peak of the emission. Use the marker-delta function to measure 6dB down one side of the emission. Reset the marker-delta function, and move the marker to the other side of the emission, until it is ( as close as possible to ) even with the reference marker level. The marker-delta reading at this point is the 6 dB bandwidth of the emission.

The spectrum analyzer is set to:

Center frequency = the highest, middle and the lowest channels

RBW = 100 kHz

Span = 40 MHz

VBW = 100 kHz (VBW ≥ RBW)

Sweep = auto

Trace = max hold

Detector function = peak

#### Measurement Data:

Frequency (MHz)	Test Results	
	Measured Bandwidth (MHz)	Result
2405	1.664	Complies
2440	1.621	Complies
2480	1.635	Complies

#### Minimum Standard:

See next pages for actual measured spectrum plots.

## 2.1.2 Maximum peak Conducted Output Power-15.247(b)

### Test Location

RF Test Room

### Test Procedures

The transmitter output is connected to a spectrum analyzer and the analyzer's internal channel power integration function is used to integrate the power over a bandwidth greater than or equal to the 99% bandwidth.

### Limit

< 1 W

### Test Results

Frequency (MHz)	Channel No.	Peak output power(dBm)	Limit	Result
2405	Low	-8.38	30dBm	Complies
2440	Middle	-8.67	30dBm	Complies
2480	High	-8.34	30dBm	Complies

See next pages for actual measured spectrum plots.

## Peak Conducted Output Power

### Peak Conducted Output Power

### 2.1.3 Power Spectral Density-15.247(e)

**Procedure:**

The peak power density is measured with a spectrum analyzer connected to the antenna terminal while the EUT is operating in transmission mode at the appropriate frequencies.

The spectrum analyzer is set to:

RBW = 3 kHz

VBW = (VBW ≥ RBW)

Sweep = 100KHz(Span/3KHz)

Span = 300 KHz

Detector function = peak

Trace = max hold

**Measurement Data:**

Frequency (MHz)	Ch.	Test Results	
		dBm	Result
2405	Low	-22.20	Complies
2440	Middle	-21.09	Complies
2480	High	-22.87	Complies

- See next pages for actual measured spectrum plots.

**Minimum Standard:**

Power Spectral Density	< 8dBm @ 3kHz BW
------------------------	------------------

See next pages for actual measured spectrum plots.

## Power Density Measurement

## 2.1.4 Band - edge -15.247(d)

### Procedure:

The bandwidth at 20dB down from the highest inband spectral density is measured with a spectrum analyzer connected to the antenna terminal, while EUT is operating in transmission mode at the appropriate frequencies.

After the trace being stable, Use the marker-to-peak function to measure 20 dB down both sides of the intentional emission.

The spectrum analyzer is set to:

Center frequency = the highest, middle and the lowest channels

RBW = 100 kHz

VBW = 100 kHz

Span = 40 MHz

Detector function = peak

Trace = max hold

Sweep = auto

### Measurement Data: Complies

- All conducted emission in any 100kHz bandwidth outside of the spread spectrum band was at least 20dB lower than the highest inband spectral density. Therefore the applying equipment meets the requirement.
- See next pages for actual measured spectrum plots.

<b>Minimum Standard:</b>	> 20 dBc
--------------------------	----------

See next pages for actual measured spectrum plots.
