Sample No:	(5209)071-1042 / (5209)097-0631
Test date:	March 23, 2009 to April 23, 2009
Test Requested:	FCC Part 15 - 2008
Test Method:	ANSI C63.4 - 2003
FCC ID:	XCV811RC

The results given in this report are related to the tested specimen of the described electrical apparatus.

CONCLUSION: The submitted sample was found to COMPLY with requirement of FCC Part 15 Subpart C.

Equipment Under Test [EUT]

Description of Sample:

Model Name: RADIO CONTROLLED TRACTOR

Model Number: (811, 23828A/B, 23838A/B, 23868A/B, 23888A/B) TCK215086-01

Rating: 9Vd.c ("6F22" size battery x 1)

Description of EUT Operation:

The Equipment Under Test (EUT) is a JOIN STAR of Radio Control toy. The transmitter is 2 sticks and 1 switch transmitter and operating at 27.14112MHz. The EUT continues to transmit stick is being pressed, Modulation by IC, and type is pulse modulation.

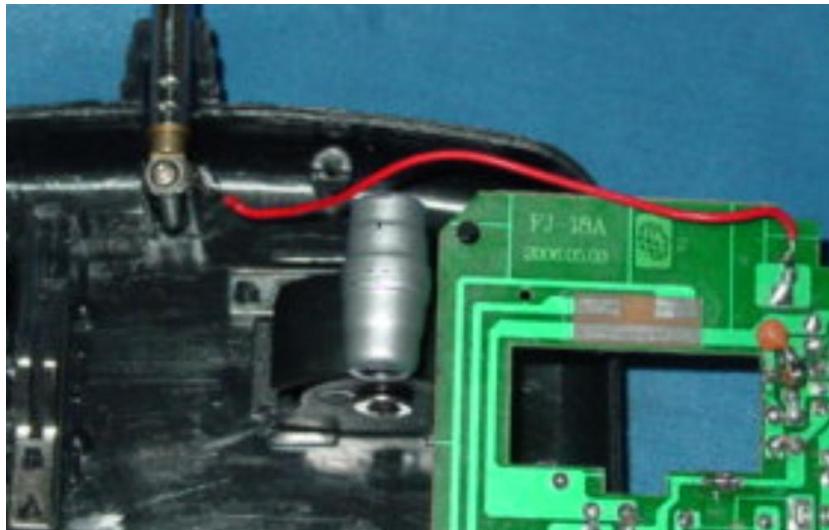

The transmitter has different control:

1. Left stick – Forward or backward control
2. Right stick – Left or right control
3. Switch “OFF/ON” – Choose OFF/ON to control turn ON or OFF the transmitter

Antenna Requirement (Section 15.203)

The EUT is use of a permanently antenna. The antenna consists of 49cm long metal antenna. It is soldered on the PCB. The antenna is not replaceable or user serviceable. The requirement of S15.203 are met. There are no deviations or exceptions to the specifications.

Radiated Emissions (Fundamental)

Test Requirement: FCC Part 15 Section 15.227

Test Method: ANSI C63.4

Test Date(s): 2009-04-23

Mode of Operation: Transmission mode

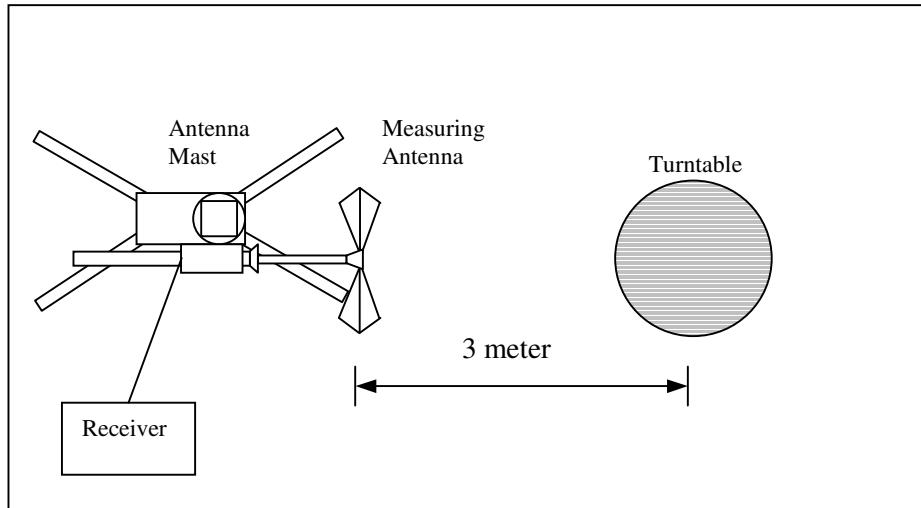

Test Procedure:

Radiated emissions measurements are investigated and taken pursuant to the procedures of ANSI C63.4 – 2003.

The equipment under test (EUT) was placed on a non-conductive turntable with dimensions of 1.5m x 1m and 0.8m high above the ground. 3m from the EUT, a broadband antenna mounting on the mast received the signal strength. During the test, each emission was maximized by: having the EUT continuously working, investigated all operating modes, rotated about all 3 axis (X, Y & Z) and considered typical configuration to obtain worst position, manipulating interconnecting cables. For battery operated equipment, the equipment tests shall be perform using new battery. The turntable was rotated to maximize the emission level. The antenna was then moving along the mast from 1m up to 4m until no more higher value was found. Both horizontal and vertical polarization of the antenna were placed and investigated.

For below 30MHz, a loop antenna with its vertical plane is place 3m from the EUT and rotated about its vertical axis for maximum response at each azimuth about the EUT. And the centre of the loop shall be 1m above the ground.

26dB Bandwidth of Fundamental Emission

Test Requirement: FCC 47 CFR 15.227
Test Method: ANSI C63.4:2003 (Section 13.1.7)
Test Date: 2009-03-20
Mode of Operation: Transmission mode

Test Method:

The bandwidth is measured at an amplitude level reduced from the reference level by a specified ratio. The reference level is the level of the highest amplitude signal observed from the transmitter at the fundamental frequency. Once the reference level is established, the equipment is conditioned with typical modulating signal to produce the worst-case (i.e. the widest) bandwidth.

Limits for 26dB Bandwidth of Fundamental Emission:

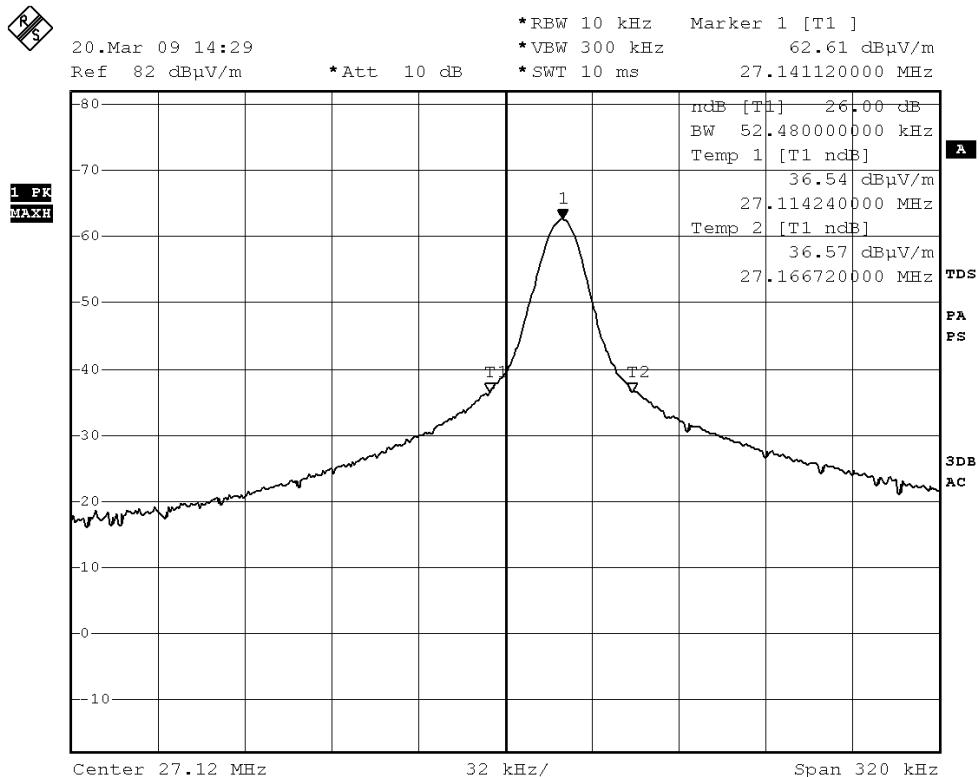

Frequency [MHz]	26dB Bandwidth [KHz]	Limits [MHz]

Duty Cycle Correction During 100msec:

Each function key sends a different series of characters, but each packet period (46.18msec) never exceeds a series of 4 long (2.08msec) and 22 short (0.64msec) pulses. Assuming any combination of short or long pulses may be obtained due to encoding the worst case transmit duty cycle would be considered (4x2.08msec) + (22x0.64msec) per 46.18msec=48.5% duty cycle. Figure A and C show the characteristics of the pulse train for one of these functions.

Remarks:

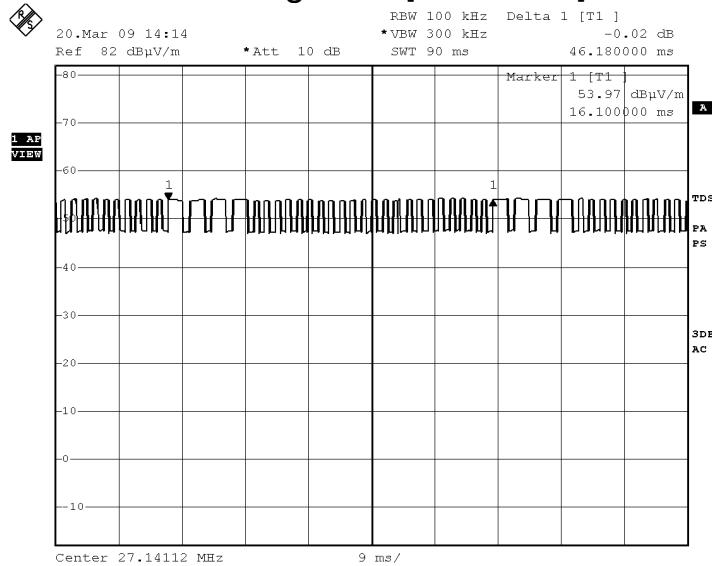

Duty Cycle Correction = $20\log(0.485) = -6.3\text{dB}$

The following figures [Figure A to Figure C] show the characteristics of the pulse train for one of these functions.
