

Operation Description

Induction cooker work theory

This micro-computer induction cooker transfers the power into high frequency wave(22kHz). Magnetic force line produced by loops will pass through bottom of steel pans making high efficient electrical backset. This way will reduce quantity of heat in translating and make high heating efficiency.

The Induction Cooker Power can be adjusted by key switches.

There is no external ground connection.because the Induction Cooker is a structure.

The input voltage of this Induction Cooker is AC120V supplied.
