## ECL-EMC Test Report No.: 14-201

**Equipment under test:** TFAH-ES70/80-17 700MHz Path  
**FCC ID:** XS5-TFAHES78

**Type of test:** FCC 47 CFR Part 90 Subpart R: 2014  
Private Land Mobile Repeater

**Measurement Procedures:** 47 CFR Parts 2: 2014 (*Frequency Allocations and Radio Treaty Matters; General Rules and Regulations*),  
Part 27: 2014 (Miscellaneous Wireless Communication Services),  
ANSI/TIA-603-C:2004, *Land Mobile FM or PM Communications Equipment Measurement and Performance Standards*

**Test result:** **Passed**

Date of issue:	03.11.14			Signature:
Issue-No.:	01	Author:		
Date of delivery:	11.08.14	Checked:		
Test dates:	17.02. – 12.08.14			
Pages:	35			

**Manufacturer:** ANDREW Wireless Systems GmbH

Industriering 10

D-86675 Buchdorf

Tel.: +49 (0)9099 69 0

Fax: +49 (0)9099 69 140

**Test Location:** Bureau Veritas Consumer Products Services

Germany GmbH

European Compliance Laboratory (ECL)

Thurn-und-Taxis-Straße 18

D-90411 Nürnberg

Tel.: +49 40 74041 0

Fax: +49 40 74041-2755

**General:**

The purpose of this report is to show compliance to the FCC regulations for devices operating under Part 27 of the Code of Federal Regulations title 47.

This report informs about the results of the EMC tests, it only refers to the equipment under test. No part of this report may be reproduced in any form, without written permission.

## 1 Test Results Summary

Name of Test	FCC Para. No.	FCC Method	FCC Spec.	Result
RF Power Output	90.635	2.1046	1000 Watts ERP	Complies
Occupied Bandwidth	90.210	2.1049	Input/Output	Complies
Spurious Emissions at Antenna Terminals	90.543	2.1051	-13dBm	Complies
Radiated Spurious emission	90.543	2.1053 TIA/EA-603	-13dBm E.I.R.P	Complies
Frequency Stability	90.539	2.1055	Must stay in band	NA
Out of Band Rejection	KDB 935210 D02 v02	KDB 935210 D02 v02	KDB 935210 D02 v02	Complies
Noise floor	KDB 935210 D02 v02	KDB 935210 D02 v02	KDB 935210 D02 v02	Complies

Frequency stability is given by: The system gets an electrical analog signal from the BSS which is converted into an analog optical signal, transmitted by the optical links and then reconverted in the Remote Unit into an analog electrical signal. During this process happens no frequency change/modification, so input and output have same frequency what can be seen under clause "Occupied Bandwidth".

## 2 Equipment under test (E.U.T.)

### 2.1 Description

Kind of equipment	TFAH-ES70/80	
Andrew Ident. Number	Id. No. TFAH-ES70/80	
Serial no.(SN)	10	
Revision	00	
Software version and ID	n. a.	
Type of modulation and Designator	LTE (G7D)	<input checked="" type="checkbox"/>
Frequency Translation	F1-F1	<input checked="" type="checkbox"/>
	F1-F2	<input type="checkbox"/>
	N/A	<input type="checkbox"/>
Band Selection	Software	<input type="checkbox"/>
	Duplexer	<input checked="" type="checkbox"/>
	Full band	<input type="checkbox"/>

#### 2.1.1 Downlink

Full pass band	758 MHz – 775 MHz
Pass band under test	758 MHz – 768 MHz
Max. composite output power based on one carrier (rated)	31 dBm = 1.26 W
Gain*	32 dB

\*see 2.1.5

#### 2.1.2 Uplink

Pass band	n. a.
Gain*	n. a.

\*see 2.1.5

Note: The EUT does not transmit over the air in the uplink direction.

#### 2.1.3 Description of EUT

TFAH-ES70/80 is a multi-band, multi-operator remote unit configuration used in conjunction with a master unit in the ION optical distribution system. This system transports up to two frequency bands simultaneously (700 MHz and 800MHz), providing a cost-effective solution for distributing capacity from one or more base stations.

This Test Report describes only the approval of the 700 MHz path (758 – 768 MHz)

## 2.1.4 Block diagram of measurement reference points

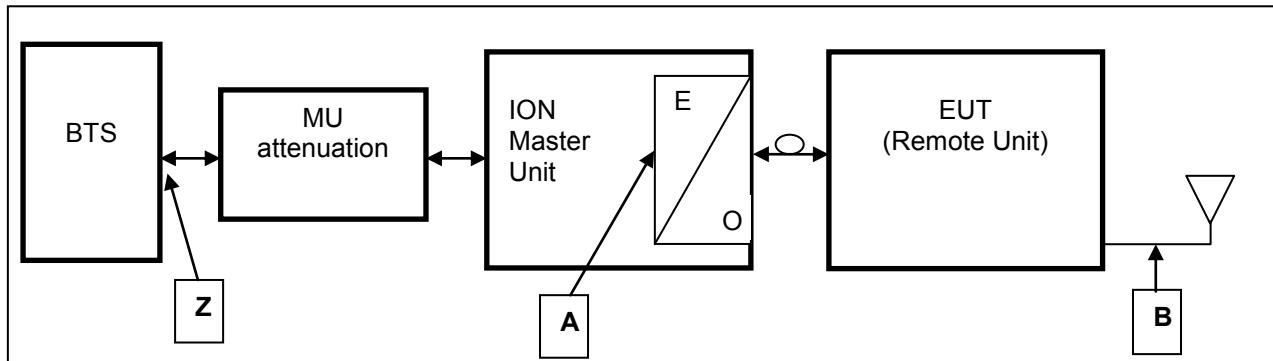

figure 2.1.4-#2 Block diagram of measurement reference points

Remote/Extension Unit is the EUT

O/E Optical/Electrical converter

SRMU SubRackMaster Unit

Reference point A, SRMU UL output, DL input

Reference point B, Remote Unit DL output, UL input

Reference point Z, BTS DL output, BTS UL input

Since a signal generator does not supply a good output signal with +33 or +43dBm, for the downlink measurement the MU Attenuation is not used.

That means for downlink measurements the signal generator is connected to measurement point A at the master optical / electrical converter and the analyzer to the measurement point B at the RU.

## 2.1.5 Downlink System Gain and Output Power

System optimized for BTS power	MU Attenuation ( <i>manual leveling</i> )	Maximum rated input power at the MU OTRX	RU Gain	Maximum rated output power at RU Antenna port
<b>Z</b>		<b>A</b>	<b>A to B</b>	<b>B</b>
+33 dBm	34 dB	-1 dBm	+32 dB	+31.0 dBm @ 1 carrier
<b>System Gain Z to B</b>	<b>-2 dB</b>			
+43 dBm	44 dB	-1 dBm	+32 dB	+31.0 dBm @ 1 carrier
<b>System Gain Z to B</b>	<b>-12 dB</b>			

table 2.1.5-#1 Equipment under test (E.U.T.) Description Downlink System Gain and Output Power

### 3 Test site (Andrew Buchdorf)

#### 3.1 Test environment

All tests were performed under the following environmental conditions:

Condition	Minimum value	Maximum value
Barometric pressure	86 kPa	106 kPa
Temperature	15°C	30°C
Relative Humidity	20 %	75 %
Power supply range	±5% of rated voltages

CIU = Calibrate in use

### 3.3 Input and output losses

All recorded power levels should be referenced to the input and output connectors of the repeater, unless explicitly stated otherwise.

The test equipment used in this test has to be calibrated, so that the functionality is also checked.

All cables, attenuators, splitter, isolator, circulator and combiner etc. must be measured before testing and used for compensation during testing.

### 3.4 Measurement uncertainty

The extended measurement uncertainty corresponds to the measurement results from the standard measurement uncertainty multiplied by the coverage factor  $k=2$ . The true value is located in the corresponding interval with a probability of 95 %.

## 4 Test site (Bureau Veritas Consumer Products Services)

FCC Test site: 96997

IC OATS: IC3475A-1

See relevant dates under section 10 of this test report.

## 5 RF Power Out: §90.635, §2.1046

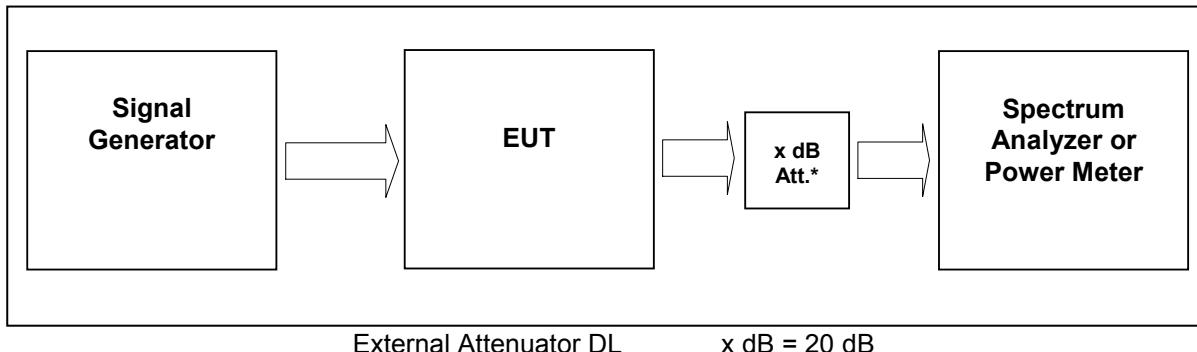

figure 5-#1 Test setup: RF Power Out: §90.635, §2.1046

Measurement uncertainty	$\pm 0.38 \text{ dB}$
Test equipment used	9054, 9233, 7444; 7306; 7144; 7454; 7453; 7341; 7449; 7368

### 5.1 Limit

Minimum standard:

§90.541 Transmitting power limits.

The transmitting power of base, mobile, portable and control stations operating in the 769-775 MHz and 799-805 MHz frequency bands must not exceed the maximum limits in this section, and must also comply with any applicable effective radiated power limits in §90.545.

(a) The transmitting power of base transmitters must not exceed the limits given in paragraphs (a), (b) and (c) of §90.635.

§ 90.635 Limitations on power and antenna height.

(a) The effective radiated power and antenna height for base stations may not exceed 1 kilowatt (30 dBw) and 304 m. (1,000 ft.) above average terrain (AAT), respectively, or the equivalent thereof as determined from the Table. These are maximum values, and applicants will be required to justify power levels and antenna heights requested.

### 5.2 Test method

§ 2.1046 Measurements required: RF power output.

(a) For transmitters other than single sideband, independent sideband and controlled carrier radiotelephone, power output shall be measured at the RF output terminals when the transmitter is adjusted in accordance with the tune-up procedure to give the values of current and voltage on the circuit elements specified in § 2.1033(c)(8). The electrical characteristics of the radio frequency load attached to the output terminals when this test is made shall be stated.

(c) For measurements conducted pursuant to paragraphs (a) and (b) of this section, all calculations and methods used by the applicant for determining carrier power or peak envelope power, as appropriate, on the basis of measured power in the radio frequency load attached to the transmitter output terminals shall be shown. Under the test conditions specified, no components of the emission spectrum shall exceed the limits specified in the applicable rule parts as necessary for meeting occupied bandwidth or emission limitations

## 5.3 Test Results

Detector RMS.

Test signal LTE:

Signal waveform according to Test Model 1.1, E-TM1.1, clause 6.1.1.1-1, table 6.1.1.1-1 of standard specification 3GPP TS 36.141 V9.3.0 (2010-03).

### 5.3.1 Downlink

Modulation	Measured at	Path	RBW VBW Span	RF Power (dBm)	RF Power (W)	Plot -
LTE	Middle	763.0 MHz	3MHz 10MHz 50MHz	31.0	1.26	5.3.1.1 #1
Maximum output power = 31.0 dBm = 1.26 W						
Limit Maximum output power 60 dBm = 1000 W (erp)						

table 5.3.1-#1 RF Power Out: §90.635, §2.1046 Test Results Downlink

The max RF Power out is 31 dBm, so the maximum antenna gain (x) can be calculated as follow:

$$\text{Limit} = 1000\text{W (erp)} = 60 \text{ dBm}$$

$$\text{Info: } 1000\text{W (erp)} = 1640\text{W (eirp)}$$

$$60 \text{ dBm} > 31 \text{ dBm} + x \quad \text{----->} \quad x = 60 \text{ dBm} - 31 \text{ dBm} = 29 \text{ dBd}$$

$$x \text{ dBi} = 29 \text{ dBd} + 2.15 = 31.15 \text{ dBi}$$

=> The antenna that will use for the complete system have to have a gain lower than 31.15 dBi, relative to a dipol.

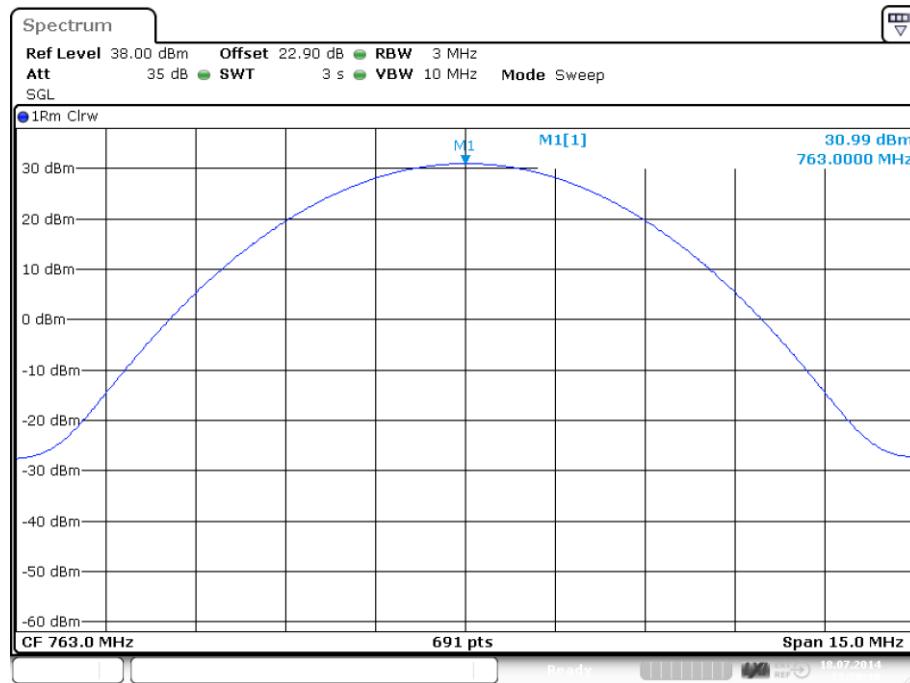

Modulation	Pin / dBm (Ref. point A)
LTE	-3.5

Date:	18.07.2014

## 6 Occupied Bandwidth: §90.210, §2.1049

External Attenuator DL  $x \text{ dB} = 20 \text{ dB}$   
 figure 6-#1 Test setup: Occupied Bandwidth: §90.210, §2.1049

Measurement uncertainty	$\pm 0.38 \text{ dB}$
Test equipment used	9054, 9052, 7366, 7367, 7299, 7280, 7363

### 6.1 Limit

The spectral shape of the output should look similar to input for all modulations.

### 6.2 Test method

Para. No.2.1049

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured under the following conditions as applicable:

### 6.3 Test results

### 7.1 Limit

#### § 90.543 Emission limitations.

Transmitters designed to operate in 769–775 MHz and 799–805 MHz frequency bands must meet the emission limitations in paragraphs (a) through (d) of this section. Transmitters operating in 763–768 MHz and 793–798 MHz bands must meet the emission limitations in (e) of this section.

Limit -13dBm

### 7.2 Test method

Para. No 2.1051 Measurements required: Spurious emissions at antenna terminals.

The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission that can be detected when the equipment is operated under the conditions specified in § 2.1049 as appropriate. The magnitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be specified.

[39 FR 5919, Feb. 15, 1974. Redesignated and amended at 63 FR 36599, July 7, 1998]

## 7.3 Test results

### 7.3.1 Downlink

#### <1MHz from Band Edge

Detector: RMS.

Modulation	Measured at Band Edge	Carriers	RBW VBW Span	Max. level (dBm)	Plot -
LTE	Lower Edge	758,7 MHz 760,1 MHz	30kHz 300kHz 6MHz	-23.2	7.3.1.1 #1
	Upper Edge	765,9 MHz 767,3 MHz			#2

table 7.3-#1 Spurious Emissions at Antenna Terminals: §90.543, §2.1051 Test results <1MHz from Band

#### >1MHz from Band Edge

Detector: RMS.

Modulation	Carrier	RBW VBW Span	Max. level (dBm)	Plot -
LTE	763.0 MHz	1MHz 3MHz 30MHz – 8GHz	-29.5	7.3.1.2 #1

table 7.3-#2 Spurious Emissions at Antenna Terminals: §90.543, §2.1051 Test results >1MHz from Band Edge

**Calculation of the limit according to §27.53 (c)(3):**

On all frequencies between 763–775 MHz and 793–805 MHz, by a factor not less than  $76 + 10 \log (P)$  dB in a 6.25 kHz band segment, for base and fixed stations;

$P_{out} = 31 \text{ dBm} = 1.26 \text{ W.}$

$76 + 10 \log(20 \text{ W} / 1 \text{ W}) \text{ dB} = 77 \text{ dB}$  Attenuation  $\Rightarrow 31 \text{ dBm} - 77 \text{ dB} = -46 \text{ dBm}$  in a 6.25 kHz band segment  
Spurious measured in the plot with a RBW of 1MHz so the limit is calculated:

$\Rightarrow -46 \text{ dBm} / 6,25 \text{ kHz} + 10 \log(10 \text{ kHz} / 6,25 \text{ kHz}) = -43,96 \text{ dBm} / 10 \text{ kHz}$   
(in the frequency range 763–775 MHz and 793–805 MHz)

maximum measured emission level for frequencies between 763–775 MHz and 793–805 MHz is below -58 dBm / 10kHz.

Test passed.

**Considerations to §27.53 (f):**

To see if the standard 27.53(f) were met a calculation of the radiated power is necessary. The modulated carrier in the range of 747-757 MHz is working with maximum power and the frequency range of 1559-1610MHz is measured. For the calculation of the radiated power in this band, it was calculated with a typical antenna gain and typical cable loss.

Used 700 MHz narrow band antennas offer a gain of 0 dBi in the in the frequency range 1559 - 1610 MHz, furthermore an antenna cable with a loss of 2 dB is used.

The measured conducted emissions in the frequency range of 1599 - 1610 MHz are below -48 dBm/MHz (see at plot 7.3.1.3).

Conducted emissions ( $<-48 \text{ dBm}$ ) + antenna gain (0 dBi) - cable loss (0 dB) = radiated emissions ( $<-48 \text{ dBm}$ ) which is below the limit of Part 27.53(f).

Even with an antenna gain of 7 dBi (more than worst case) in the frequency range of 1599 - 1610 MHz, we are still under the limit of Part 27.53(f) with a radiated emission of -41 dBm.

Therefore the emission limit is met.

Test passed.

BUREAU  
VERITAS

## 10 Radiated Spurious Emissions at the ECL (Bureau Veritas): §90.543, §2.1053, RSS-Gen, RSS-131

picture 10.1: name plate

picture 10.2: Test setup: Field Strength Emission <1 GHz @3m in the SAC

picture 7.3: Test setup: Field Strength Emission >1 GHz @3m in the SAC

This clause specifies requirements for the measurement of radiated emission.

Frequency range	Distance: EUT <> antenna / location	Limit	Test method
30 MHz - 1 GHz	3 metres / SAC	FCC 47 CFR Part 90.210	TIA/EIA-603-C:2004
1 GHz – 21 GHz	3 metres / SAC		

**Test equipment used:**

Designation	Type	Manufacturer	Invent.-no.	Cal.-date	due Cal.-date	used
EMI test receiver	ESI40	Rohde & Schwarz	E1687	28.11.2013	28.11.2014	X
Antenna	CBL 6111	Chase	K1026	27.06.2014	27.06.2015	X
Pre amplifier	AM1431	Miteq	K1721	16.04.2014	16.04.2015	X
Antenna	HL 025	R&S	K1114	03.03.2014	03.03.2015	X
Preamplifier	AFS4-00102000	Miteq	K838	03.04.2014	03.04.2015	X
RF Cable	Sucoflex 100	Suhner	K1760	03.07.2014	03.07.2015	X

The REMI version 2.135 has been used for max search.

**Test set-up:**

Test location: SAC  
 Both, the Fully Anechoic Chamber (FAC) and the Semi Anechoic Chamber (SAC) fulfil the requirements of ANSI C63.4 and CISPR 16-1-4 with regards to NSA and SVSWR.

Test Voltage: 115V / 60 Hz  
 Type of EUT: Wall mounted

**Measurement uncertainty:**

Measurement uncertainty expanded (95% or K=2)	± 4,7 dB for ANSI C63.4 measurement ± 0,5 dB for TIA-603 measurement
--	---

## 10.1 Method of Measurement

### Measurement procedure. TIA-603-C

The antenna substitution method is used to determine the equivalent radiated power at spurious frequencies. The spurious emissions are measured at a distance of 3 meters. The EUT is then replaced with a reference substitution antenna with a known gain referenced to a dipole. This antenna is fed with a signal at the spurious frequency. The level of the signal is adjusted to repeat the previously measured level. The resulting eirp is the signal level fed to the reference antenna corrected for gain referenced to an isotropic dipole (see Figure 7.2).

From KDB (AMPLIFIER, BOOSTER, AND REPEATER REMINDER SHEET):

Radiated spurs (enclosure) – Use of CW signal (low, mid. and high freq.) is acceptable rather than all modulations.

The maximum RFI field strength was determined during the measurement by rotating the turntable ( $\pm 180$  degrees) and varying the height of the receive antenna ( $h = 1 \dots 4$  m) as like defined in ANSI C63.4. A measurement receiver has been used with a RBW 120 kHz up to 1 GHz and 1 MHz above 1 GHz. Steps with during pre measurement was half the RBW.

Both, the Fully Anechoic Chamber (FAC) and the Semi Anechoic Chamber (SAC) fulfil the requirements of ANSI C63.4 and CISPR 16-1-4 with regards to NSA and SVSWR.

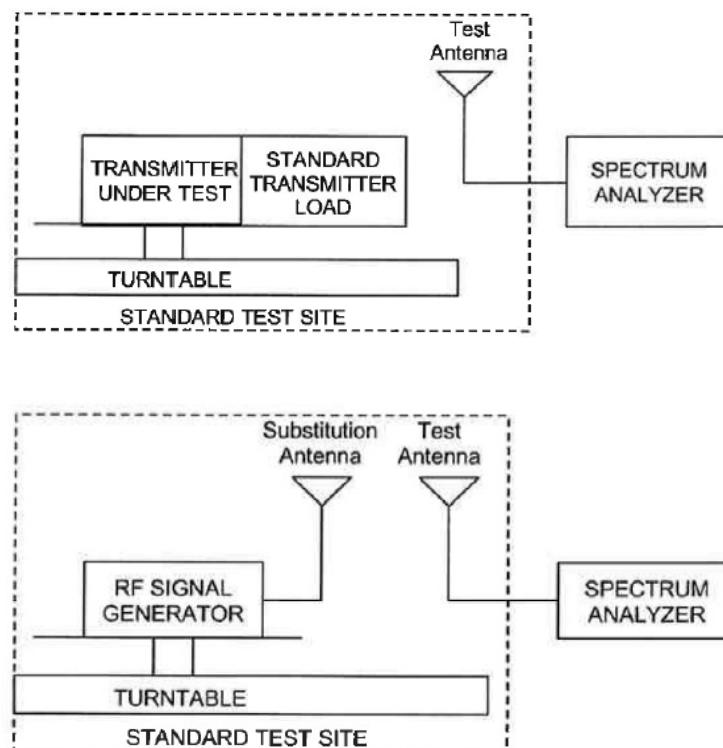

Figure #7.2 Substitution methods TIA/EIA-603-C

## 10.2 Limit

### § 90.543 Emission limitations.

Transmitters designed to operate in 769–775 MHz and 799–805 MHz frequency bands must meet the emission limitations in paragraphs (a) through (d) of this section. Transmitters operating in 763–768 MHz and 793–798 MHz bands must meet the emission limitations in(e) of this section.

Limit -13dBm

## 10.3 Receiver Settings

	up to 1 GHz	above 1 GHz
Measurement bandwidth	120 kHz	1 MHz
Step width	60 kHz	500 kHz
Dwell time		20ms
Detector	Peak	Peak

## 10.4 Climatic values in the lab

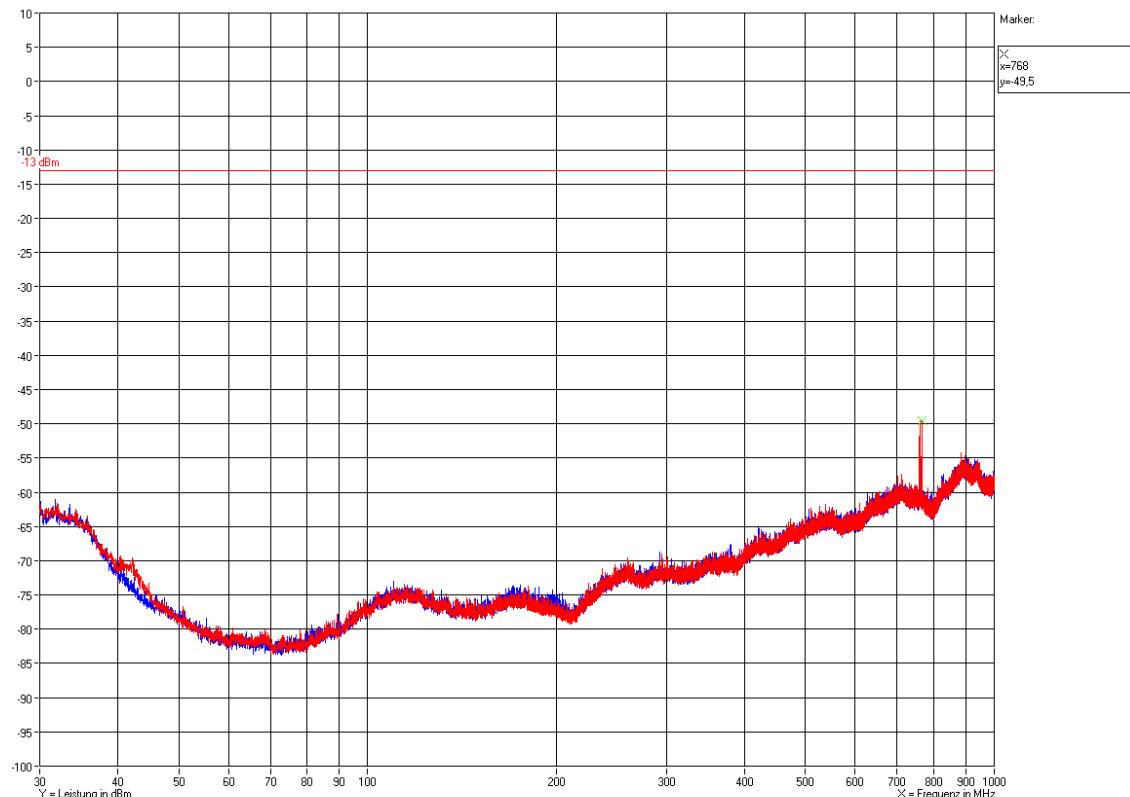

Temperature	22°C
Relative Humidity	43%
Air-pressure	1014 hPa
