## Section 1 Report summary

### 1.1 Test specifications

| FCC 47 CFR Part 15, Subpart C, Clause 15.247 | Operation in the 902–928 MHz, 2400–2483.5 MHz, and 5725–585 MHz  |
|--|--|
| RSS-247, Issue 2, Feb 2017, Section 5        | Digital Transmission Systems (DTSs), Frequency Hopping Systems (FHSs) and Licence-Exempt Local Area Network (LE-LAN) Devices |

#### 1.2 Test methods

| 558074 D01 15.247 Meas Guidance v05r02 | Guidance for compliance measurements on digital transmission system, frequency hopping spread  |
|--|--|
| (April 2, 2019)                        | spectrum system, and hybrid system devices operating under section 15.247 of the FCC rules.    |
| ANSI C63.10 v2013                      | American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices |
| RSS-102, Issue 5, March 19, 2015       | Radio Frequency (RF) Exposure Compliance of Radiocommunication Apparatus (All Frequency Bands) |

### 1.3 Exclusions

None

### 1.4 Statement of compliance

In the configuration tested, the EUT was found compliant.

Testing was performed against all relevant requirements of the test standard except as noted in section 1.3 above. Results obtained indicate that the product under test complies In full with the requirements tested. The test results relate only to the items tested.

Determining compliance is based on the results of the compliance measurement, not taking into account measurement uncertainty, in accordance with section 1.3 of ANSI C63.10 v2013.

See "Summary of test results" for full details.

### 1.5 Test report revision history

Table 1.5-1: Test report revision history

| Revision # | Date of issue   | Details of changes made to test report |
|------------|-----------------|--|
| TRF        | October 6, 2021 | Original report issued                 |

# Section 2 Engineering considerations

### 2.1 Modifications incorporated in the EUT for compliance

There were no modifications performed to the EUT during this assessment.

### 2.2 Technical judgment

As provided by client, the RF module under test is applying for limited single-modular approval, compliance is demonstrated with specific host.

### 2.3 Model variant declaration

There were no model variants declared by the applicant.

### 2.4 Deviations from laboratory tests procedures

No deviations were made from laboratory procedures.

## Section 3 Test conditions

### 3.1 Atmospheric conditions

| Temperature       | 15 °C – 35 °C                           |
|-------------------|---|
| Relative humidity | 20 % – 75 %                             |
| Air pressure      | 86 kPa (860 mbar) – 106 kPa (1060 mbar) |

When it is impracticable to carry out tests under these conditions, a note to this effect stating the ambient temperature and relative humidity during the tests shall be recorded and stated.

### 3.2 Power supply range

The normal test voltage for equipment to be connected to the mains shall be the nominal mains voltage. For the purpose of the present document, the nominal voltage shall be the declared voltage, or any of the declared voltages ±5 %, for which the equipment was designed.

## Section 4 Measurement uncertainty

### 4.1 Uncertainty of measurement

UKAS Lab 34 and TIA-603-B have been used as guidance for measurement uncertainty reasonable estimations with regards to previous experience and validation of data. Nemko Canada, Inc. follows these test methods in order to satisfy ISO/IEC 17025 requirements for estimation of uncertainty of measurement for wireless products.

Measurement uncertainty budgets for the tests are detailed below. Measurement uncertainty calculations assume a coverage factor of K = 2 with 95% certainty.

**Table 4.1-1:** Measurement uncertainty calculations

| Test name                         | Measurement uncertainty, ±dB |
|-----------------------------------|------------------------------|
| All antenna port measurements     | 0.55                         |
| Occupied bandwidth                | 4.45                         |
| Conducted spurious emissions      | 1.13                         |
| Radiated spurious emissions       | 3.78                         |
| AC power line conducted emissions | 3.55                         |

# Section 5 Information provided by the applicant

### 5.1 Disclaimer

This section contains information provided by the applicant and has been utilized to support the test plan. Inaccurate information provided by the applicant can affect the validity of the results contained within this test report. Nemko accepts no responsibility for the information contained within this section and the impact it may have on the test plan and resulting measurements.

### 5.2 Applicant/Manufacture

| Applicant name      | Technologies HumanWare Inc.   |
|---------------------|---|
| Applicant address   | 1800, Jean-Berchmans-Michaud street Drummondville, (Quebec), Canada J2C 7G7 |
| Manufacture name    | Same as applicant   |
| Manufacture address | Same as applicant   |

### 5.3 EUT information

| Product                        | BT + WIFI module  |
|--------------------------------|---|
| Model                          | PCBA-0131-A1.0  |
| Host Model                     | DA2   |
| Model variant(s)               | None  |
| Serial number                  | None  |
| Part number                    | PCBA-0131   |
| Power supply requirements      | 3.0 to 3.6 Vdc, 300 mA , From host AC: 120 V, 50/60 Hz power cord   |
| Product description and theory | The PCBA-0131 RF module integrates a PCB antenna. The module allows the host to connect to Wifi networks via a SDIO |
| of operation                   | interface. It also allows the host to use the Bluetooth protocol via a UART interface.                              |

### 5.4 Radio technical information

| Category of Wideband Data          | ☐ Frequency Hopping Spread Spectrum (FHSS) equipment  |
|------------------------------------|---|
| Transmission equipment             | ☑ Other types of Wideband Data Transmission equipment (e.g. DSSS, OFDM, etc.).                                  |
| Frequency band                     | 2400–2483.5 MHz   |
| Frequency Min (MHz)                | 20 MHz bandwidth: 2412  |
|                                    | 40 MHz bandwidth: 2422  |
| Frequency Max (MHz)                | 20 MHz bandwidth: 2462  |
|                                    | 40 MHz bandwidth: 2452  |
| Channel numbers                    | 20 MHz bandwidth: 1–11  |
|                                    | 40 MHz bandwidth: 3–9   |
| RF power Max (W), Conducted        | 0.0562 (17.5 dBm)   |
| Measured BW (kHz), 99% OBW         | 20 MHz bandwidth: 17617   |
|                                    | 40 MHz bandwidth: 36354   |
| Type of modulation                 | 802.11 b/g/n HT20/n HT40  |
| Emission classification            | G1D, W7D  |
| Transmitter spurious, dBμV/m @ 3 m | 53.5 Average, @2483.5 MHz   |
| Antenna information                | Molex 211964 2.4GHz/5GHz Ceramic SMT antenna, max peak gain: 2.1 dBi at 2.4 GHz band and 2.2 dBi at 5 GHz band. |

### 5.5 EUT setup details

#### 5.5.1 Radio exercise details

| Operating conditions | The EUT is soldered on Humanware Digital Talking Book Machine Main PCB, the DA2. The DA2 provides 3.1Vdc power         |
|----------------------|--|
|                      | to the EUT. The DA2 also interfaces to the EUT with a digital interface (SDIO and UART). The DA2 runs on Linux and has |
|                      | the appropriate drivers to control the EUT.  |
|                      | In order to control the EUT in the appropriate mode, the DA2 is connected to a laptop with a serial to USB             |
|                      | communication adapter. The operator uses a terminal interface on the laptop to communicate with the DA2.               |
|                      | The DA2 has a special build for this purpose, the "certification-rtwpriv-wifi-bt-continous-2021-06-10".                |
| Transmitter state    | Transmitter set into continuous mode.  |

Transmitter configuration as below:

#### IEEE 802.11b Mode: CCK

| Frequency | Channel | Tested Data rate |
|-----------|---------|------------------|
| 2412      | 1       | 1Mbps            |
| 2437      | 6       | 1Mpbs            |
| 2462      | 11      | 1Mbps            |

### IEEE 802.11g Mode : OFDM

| Frequency | Channel | Tested Data rate |
|-----------|---------|------------------|
| 2412      | 1       | 6Mbps            |
| 2437      | 6       | 6Mpbs            |
| 2462      | 11      | 6Mbps            |

### IEEE 802.11n , HT20, Mode : OFDM

| Frequency | Channel | Tested Data rate |
|-----------|---------|------------------|
| 2412      | 1       | 6,5Mbps          |
| 2437      | 6       | 6,5Mpbs          |
| 2462      | 11      | 6,5Mbps          |

### IEEE 802.11n , HT40, Mode : OFDM

| Frequency | Channel | Tested Data rate |
|-----------|---------|------------------|
| 2422      | 3       | 13.5Mbps         |
| 2437      | 6       | 13.5Mpbs         |
| 2452      | 9       | 13.5Mbps         |

Test name

Testing data
Number of frequencies
FCC Part 15 Subpart A and RSS-Gen, Issue 5

### 8.2 Number of frequencies

#### 8.2.1 References, definitions and limits

#### FCC §15.31:

(m) Measurements on intentional radiators or receivers shall be performed and, if required, reported for each band in which the device can be operated with the device operating at the number of frequencies in each band specified in the following table.

#### RSS-Gen, Clause 6.9:

Except where otherwise specified, measurements shall be performed for each frequency band of operation for which the radio apparatus is to be certified, with the device operating at the frequencies in each band of operation shown in table below. The frequencies selected for measurements shall be reported in the test report.

Table 8.2-1: Frequency Range of Operation

| Frequency range over which the device |                                     | Location of measurement frequency inside the      |
|---------------------------------------|-------------------------------------|---|
| operates (in each band)               | Number of test frequencies required | operating frequency range                         |
| 1 MHz or less                         | 1                                   | Center (middle of the band)                       |
| 1–10 MHz                              | 2                                   | 1 near high end, 1 near low end                   |
| Greater than 10 MHz                   | 3                                   | 1 near high end, 1 near center and 1 near low end |

Notes: "near" means as close as possible to or at the centre / low end / high end of the frequency range over which the device operates.

| Tested by | Yong Huang | Test date | June 22, 2021 |

#### 8.2.3 Observations, settings and special notes

### ANSI C63.10, Clause 5.6.2.1:

The number of channels tested can be reduced by measuring the center channel bandwidth first and then applying the following relaxations as appropriate:

- a) For each operating mode, if the measured channel bandwidth on the middle channel is at least 150% of the minimum permitted bandwidth, then it is not necessary to measure the bandwidth on the high and low channels.
- b) For multiple-input multiple-output (MIMO) systems, if the measured channel bandwidth on testing the middle channel exceeds the minimum permitted bandwidth by more than 50% on one transmit chain, then it is not necessary to repeat testing on the other chains.
- c) If the measured channel bandwidth on the middle channel is less than 50% of the maximum permitted bandwidth, then it is not necessary to measure the bandwidth on the high and low channels.

#### ANSI C63.10, Clause 5.6.2.2:

For devices with multiple operating modes, measurements on the middle channel can be used to determine the worst-case mode(s). The worst-case modes are as follows:

- Band edge requirements—Measurements on the mode with the widest bandwidth can be used to cover the same channel (center frequency) on modes with narrower bandwidth that have the same or lower output power for each modulation family (e.g., OFDM and direct sequence spread spectrum).
- b) Spurious emissions—Measure the mode with the highest output power and the mode with the highest output power spectral density for each modulation family (e.g., OFDM and direct sequence spread spectrum).
- c) In-band PSD—Measurements on the mode with the narrowest bandwidth can be used to cover all modes within the same modulation family of an equal or lower output power provided the result is less than 50% of the limit.

Testing data
Antenna requirement
FCC Part 15 Subpart C and RSS-Gen, Issue 5

### 8.3 Antenna requirement

#### 8.3.1 References, definitions and limits

#### FCC §15.203:

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. This requirement does not apply to intentional radiators that must be professionally installed, such as perimeter protection systems and some field disturbance sensors, or to other intentional radiators which, in accordance with §15.31(d), must be measured at the installation site. However, the installer shall be responsible for ensuring that the proper antenna is employed so that the limits in this part are not exceeded.

#### FCC §15.247:

- (b) The maximum peak conducted output power of the intentional radiator shall not exceed the following:
- (4) The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

#### RSS-Gen, Clause 6.8:

The applicant for equipment certification shall provide a list of all antenna types that may be used with the transmitter, where applicable (i.e. for transmitters with detachable antenna), indicating the maximum permissible antenna gain (in dBi) and the required impedance for each antenna. The test report shall demonstrate the compliance of the transmitter with the limit for maximum equivalent isotropically radiated power (e.i.r.p.) specified in the applicable RSS, when the transmitter is equipped with any antenna type, selected from this list.

For expediting the testing, measurements may be performed using only the antenna with highest gain of each combination of transmitter and antenna type, with the transmitter output power set at the maximum level. However, the transmitter shall comply with the applicable requirements under all operational conditions and when in combination with any type of antenna from the list provided in the test report.

Testing data

AC power line conducted emissions limits FCC Part 15 Subpart C and RSS-Gen, Issue 5

### 8.4 AC power line conducted emissions limits

#### 8.4.1 References, definitions and limits

#### FCC §15.207:

(a) Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table, as measured using a 50 μH/50 Ω line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

#### ANSI C63.10, Clause 6.2:

If the EUT normally receives power from another device that in turn connects to the public utility ac power lines, measurements shall be made on that device with the EUT in operation to demonstrate that the device continues to comply with the appropriate limits while providing the EUT with power. If the EUT is operated only from internal or dedicated batteries, with no provisions for connection to the public utility ac power lines (600 VAC or less) to operate the EUT (such as an adapter), then ac power-line conducted measurements are not required.

For direct current (dc) powered devices where the ac power adapter is not supplied with the device, an "off-the-shelf" unmodified ac power adapter shall be used. If the device is supposed to be installed in a host (e.g., the device is a module or PC card), then it is tested in a typical compliant host.

#### RSS-Gen, Clause 8.8:

A radio apparatus that is designed to be connected to the public utility (AC) power line shall ensure that the radio frequency voltage, which is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz, shall not exceed the limits in table helow.

Unless the requirements applicable to a given device state otherwise, for any radio apparatus equipped to operate from the public utility AC power supply either directly or indirectly (such as with a battery charger), the radio frequency voltage of emissions conducted back onto the AC power lines in the frequency range of 0.15 MHz to 30 MHz shall not exceed the limits shown in table below. The more stringent limit applies at the frequency range boundaries.

Table 8.4-1: Conducted emissions limit

|                            | Conducted er | missions limit, dBμV |
|----------------------------|--------------|----------------------|
| Frequency of emission, MHz | Quasi-peak   | Average**            |
| 0.15-0.5                   | 66 to 56*    | 56 to 46*            |
| 0.5–5                      | 56           | 46                   |
| 5–30                       | 60           | 50                   |

Testing data
Minimum 6 dB bandwidth for DTS systems
FCC Part 15 Subpart C and RSS-247, Issue 2

### 8.5 Minimum 6 dB bandwidth for DTS systems

#### 8.5.1 References, definitions and limits

#### FCC §15.247:

- (a) Operation under the provisions of this Section is limited to frequency hopping and digitally modulated intentional radiators that comply with the following provisions:
- (2) Systems using digital modulation techniques may operate in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz bands. The minimum 6 dB bandwidth shall be at least 500 kHz.

#### RSS-247, Clause 5.2:

DTSs include systems that employ digital modulation techniques resulting in spectral characteristics similar to direct sequence systems. The following applies to the bands 902-928 MHz and 2400-2483.5 MHz:

a. The minimum 6 dB bandwidth shall be 500 kHz.

#### RSS-Gen, Clause 6.7:

6 dB bandwidth is defined as the frequency range between two points, one at the lowest frequency below and one at the highest frequency above the carrier frequency, at which the maximum power level of the transmitted emission is attenuated 6 dB below the maximum in-band power level of the modulated signal, where the two points are on the outskirts of the in-band emission.

For the 99% emission bandwidth, the trace data points are recovered and directly summed in linear power level terms. The recovered amplitude data points, beginning at the lowest frequency, are placed in a running sum until 0.5% of the total is reached, and that frequency recorded. The process is repeated for the highest frequency data points (starting at the highest frequency, at the right side of the span, and going down in frequency). This frequency is then recorded. The difference between the two recorded frequencies is the occupied bandwidth (or the 99% emission bandwidth).

#### 8.5.2 Test summary

| Verdict   | Pass       |                 |               |
|-----------|------------|-----------------|---------------|
| Tested by | Yong Huang | Test start date | June 17, 2021 |

#### 8.5.3 Observations, settings and special notes

The test was performed as per KDB 558074, section 8.2 with reference to ANSI C63.10 subclause 11.8. 99% occupy bandwidth is tested for information purpose.

Spectrum analyser settings:

| Resolution bandwidth | 100 kHz  |

Transmitter output power of

Transmitter output power and e.i.r.p. requirements FCC Part 15 Subpart C and RSS-247, Issue 2

### 8.6 Transmitter output power and e.i.r.p. requirements for DTS in 2.4 GHz

#### 8.6.1 References, definitions and limits

#### FCC §15.247:

- (b) The maximum peak conducted output power of the intentional radiator shall not exceed the following:
- (3) For systems using digital modulation in the 2400–2483.5 MHz band: 1 W (30 dBm). As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power. Maximum Conducted Output Power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power level. If multiple modes of operation are possible (e.g., alternative modulation methods), the maximum conducted output power is the highest total transmit power occurring in any mode.
- (4) The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.
- (c) Operation with directional antenna gains greater than 6 dBi.
- (1) Fixed point-to-point operation:
- (i) Systems operating in the 2400–2483.5 MHz band that are used exclusively for fixed, point-to-point operations may employ transmitting antennas with directional gain greater than 6 dBi provided the maximum conducted output power of the intentional radiator is reduced by 1 dB for every 3 dB that the directional gain of the antenna exceeds 6 dBi.
- (iii) Fixed, point-to-point operation, as used in paragraphs (c)(1)(i) and (c)(1)(ii) of this section, excludes the use of point-to-multipoint systems, omnidirectional applications, and multiple co-located intentional radiators transmitting the same information. The operator of the spread spectrum or digitally modulated intentional radiator or, if the equipment is professionally installed, the installer is responsible for ensuring that the system is used exclusively for fixed, point-to-point operations. The instruction manual furnished with the intentional radiator shall contain language in the installation instructions informing the operator and the installer of this responsibility.
- (2) In addition to the provisions in paragraphs (b)(1), (b)(3), (b)(4) and (c)(1)(i) of this section, transmitters operating in the 2400–2483.5 MHz band that emit multiple directional beams, simultaneously or sequentially, for the purpose of directing signals to individual receivers or to groups of receivers provided the emissions comply with the following:
- (i) Different information must be transmitted to each receiver.
- (ii) If the transmitter employs an antenna system that emits multiple directional beams but does not do emit multiple directional beams simultaneously, the total output power conducted to the array or arrays that comprise the device, i.e., the sum of the power supplied to all antennas, antenna elements, staves, etc. and summed across all carriers or frequency channels, shall not exceed the limit specified in paragraph (b)(1) or (b)(3) of this section, as applicable. However, the total conducted output power shall be reduced by 1 dB below the specified limits for each 3 dB that the directional gain of the antenna/antenna array exceeds 6 dBi. The directional antenna gain shall be computed as follows:
- (A) The directional gain shall be calculated as the sum of 10 log (number of array elements or staves) plus the directional gain of the element or stave having the highest gain.
- (B) A lower value for the directional gain than that calculated in paragraph (c)(2)(ii)(A) of this section will be accepted if sufficient evidence is presented, e.g., due to shading of the array or coherence loss in the beamforming.
- (iii) If a transmitter employs an antenna that operates simultaneously on multiple directional beams using the same or different frequency channels, the power supplied to each emission beam is subject to the power limit specified in paragraph (c)(2)(ii) of this section. If transmitted beams overlap, the power shall be reduced to ensure that their aggregate power does not exceed the limit specified in paragraph (c)(2)(ii) of this section. In addition, the aggregate power transmitted simultaneously on all beams shall not exceed the limit specified in paragraph (c)(2)(ii) of this section by more than 8 dB.
- (iv) Transmitters that emit a single directional beam shall operate under the provisions of paragraph (c)(1) of this section.

Testing data

Transmitter output power and e.i.r.p. requirements FCC Part 15 Subpart C and RSS-247, Issue 2

References, definitions and limits, continued

#### RSS-247, Clause 5.4:

Devices shall comply with the following requirements, where applicable:

d. For DTSs employing digital modulation techniques operating in the 2400–2483.5 MHz band,, the maximum peak conducted output power shall not exceed 1 W. The e.i.r.p. shall not exceed 4 W, except as provided in section 5.4(e).

As an alternative to a peak power measurement, compliance can be based on a measurement of the maximum conducted output power. The maximum conducted output power is the total transmit power delivered to all antennas and antenna elements, averaged across all symbols in the signalling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or transmitting at a reduced power level. If multiple modes of operation are implemented, the maximum conducted output power is the highest total transmit power occurring in any mode.

- e. Fixed point-to-point systems in the 2400–2483.5 MHz band are permitted to have an e.i.r.p. higher than 4 W provided that the higher e.i.r.p. is achieved by employing higher gain directional antennas and not higher transmitter output powers. Point-to-multipoint systems, omnidirectional applications and multiple co-located transmitters transmitting the same information are prohibited from exceeding an e.i.r.p. of 4 W.
- f. Transmitters operating in the band 2400–2483.5 MHz, may employ antenna systems that emit multiple directional beams simultaneously or sequentially, for the purpose of directing signals to individual receivers or to groups of receivers, provided that the emissions comply with the following:
- i. Different information must be transmitted to each receiver.
- ii. If the transmitter employs an antenna system that emits multiple directional beams, but does not emit multiple directional beams simultaneously, the total output power conducted to the array or arrays that comprise the device (i.e. the sum of the power supplied to all antennas, antenna elements, staves, etc., and summed across all carriers or frequency channels) shall not exceed the applicable output power limit specified in sections 5.4(b) and 5.4(d). However, the total conducted output power shall be reduced by 1 dB below the specified limits for each 3 dB that the directional gain of the antenna/antenna array exceeds 6 dBi. The directional antenna gain shall be computed as the sum of 10 log (number of array elements or staves) plus the directional gain of the element or stave having the highest gain.
- iii. If a transmitter employs an antenna that operates simultaneously on multiple directional beams using the same or different frequency channels, the power supplied to each emission beam is subject to the applicable power limit specified in sections 5.4(b) and 5.4(d). If transmitted beams overlap, the power shall be reduced to ensure that their aggregate power does not exceed the applicable limit specified in sections 5.4(b) and 5.4(d). In addition, the aggregate power transmitted simultaneously on all beams shall not exceed the applicable limit specified in sections 5.4(b) and 5.4(d) by more than 8 dB.
- iv. Transmitters that transmit a single directional beam shall operate under the provisions of sections 5.4(b), 5.4(d) and 5.4(e).

Spurious (out-of-band) unwanted emissions FCC Part 15 Subpart C and RSS-247, Issue 2

### 8.7 Spurious (out-of-band) unwanted emissions

#### 8.7.1 References, definitions and limits

#### FCC §15.247:

(d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

#### RSS-247, Clause 5.5:

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the RF power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided that the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of root-mean-square averaging over a time interval, as permitted under section 5.4(d), the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general field strength limits specified in RSS-Gen is not required.

Table 8.7-1: FCC §15.209 and RSS-Gen – Radiated emission limits

|                | Field strength of emissions |                                   |                         |  |  |
|----------------|-----------------------------|-----------------------------------|-------------------------|--|--|
| Frequency, MHz | μV/m                        | dBμV/m                            | Measurement distance, m |  |  |
| 0.009-0.490    | 2400/F                      | 67.6 – 20 × log <sub>10</sub> (F) | 300                     |  |  |
| 0.490-1.705    | 24000/F                     | $87.6 - 20 \times log_{10}(F)$    | 30                      |  |  |
| 1.705-30.0     | 30                          | 29.5                              | 30                      |  |  |
| 30–88          | 100                         | 40.0                              | 3                       |  |  |
| 88–216         | 150                         | 43.5                              | 3                       |  |  |
| 216–960        | 200                         | 46.0                              | 3                       |  |  |
| above 960      | 500                         | 54.0                              | 3                       |  |  |

Notes: In

In the emission table above, the tighter limit applies at the band edges.

For frequencies above 1 GHz the limit on peak RF emissions is 20 dB above the maximum permitted average emission limit applicable to the equipment under test.

Testing data
Spurious (out-of-band) unwanted emissions
FCC Part 15 Subpart C and RSS-247, Issue 2

#### 8.7.3 Observations, settings and special notes

- As part of the current assessment, the test range of 9 kHz to 10<sup>th</sup> harmonic has been fully considered and compared to the actual frequencies utilized within the EUT. Since the EUT contains a transmitter in the GHz range, the EUT has been deemed compliant without formal testing in the 9 kHz to 30 MHz test range, therefore formal test results (tabular data and/or plots) are not provided within this test report.
- Emissions in restricted bands were measured with conducted method, where the antenna gain was included in the factors of results. Cabinet radiated
  emissions were performed with a 50 Ohm load in place of the antenna of EUT.
- EUT was set to transmit with 100 % duty cycle.
- Radiated measurements were performed at a distance of 3 m below 18 GHz, and 1 m above 18 GHz.
- DTS emissions in non-restricted frequency bands test was performed as per KDB 558074, section 8.5 with reference to ANSI C63.10 subclause 11.11.
- Since fundamental power was tested using the maximum peak conducted output power procedure to demonstrate compliance, the spurious emissions limit is -20 dBc/100 kHz.
- DTS emissions in restricted frequency bands test was performed as per KDB 558074, section 8.6 with reference to ANSI C63.10 subclause 11.12.
- DTS band-edge emission measurements test was performed as per KDB 558074, section 8.7 with reference to ANSI C63.10 subclause 11.13.

Spectrum analyser settings for radiated measurements within restricted bands below 1 GHz:

| Resolution bandwidth: | 100 kHz  |
|-----------------------|----------|
| Video bandwidth:      | 300 kHz  |
| Detector mode:        | Peak     |
| Trace mode:           | Max Hold |

Spectrum analyser settings for peak radiated measurements within restricted bands above 1 GHz:

| Resolution bandwidth: | 1 MHz    |
|-----------------------|----------|
| Video bandwidth:      | 3 MHz    |
| Detector mode:        | Peak     |
| Trace mode:           | Max Hold |

Spectrum analyser settings for average radiated measurements within restricted bands above 1 GHz:

| Resolution bandwidth: | 1 MHz    |
|-----------------------|----------|
| Video bandwidth:      | 10 Hz    |
| Detector mode:        | Peak     |
| Trace mode:           | Max Hold |

Spectrum analyser settings for conducted spurious emissions measurements:

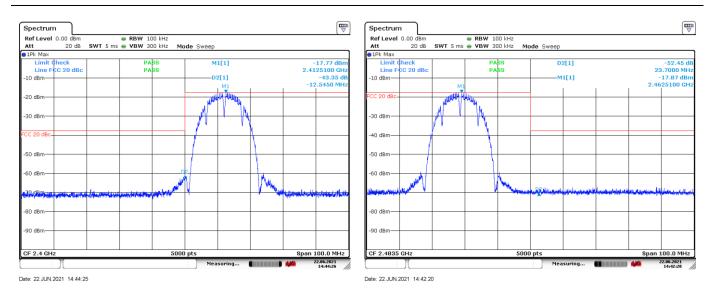

| Resolution bandwidth: | 100 kHz  |
|-----------------------|----------|
| Video bandwidth:      | 300 kHz  |
| Detector mode:        | Peak     |
| Trace mode:           | Max Hold |

Power spectral density for digitally modulated devices

FCC Part 15 Subpart C and RSS-247, Issue 2

## 8.8 Power spectral density for digitally modulated devices

## 8.8.1 References, definitions and limits

#### FCC §15.247:

- (e) For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of paragraph (b) of this section. The same method of determining the conducted output power shall be used to determine the power spectral density.
- (f) For the purposes of this section, hybrid systems are those that employ a combination of both frequency hopping and digital modulation techniques. The frequency hopping operation of the hybrid system, with the direct sequence or digital modulation operation turned-off, shall have an average time of occupancy on any frequency not to exceed 0.4 seconds within a time period in seconds equal to the number of hopping frequencies employed multiplied by 0.4. The power spectral density conducted from the intentional radiator to the antenna due to the digital modulation operation of the hybrid system, with the frequency hopping operation turned off, shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

#### RSS-247, Clause 5.2:

DTSs include systems that employ digital modulation techniques resulting in spectral characteristics similar to direct sequence systems. The following applies to the bands 902-928 MHz and 2400-2483.5 MHz:

b. The transmitter power spectral density conducted from the transmitter to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of section 5.4(d), (i.e. the power spectral density shall be determined using the same method as is used to determine the conducted output power).

#### RSS-247, Clause 5.3:

Hybrid systems employ a combination of both frequency hopping and digital transmission techniques and shall comply with the following:

b. With the frequency hopping turned off, the digital transmission operation shall comply with the power spectral density requirements for digital modulation systems set out in of section 5.2(b) or section 6.2.4 for hybrid devices operating in the band 5725–5850 MHz.

## 8.8.2 Test summary

| Verdict   | Pass       |           |               |
|-----------|------------|-----------|---------------|
| Tested by | Yong Huang | Test date | June 22, 2021 |

## 8.8.3 Observations, settings and special notes

Power spectral density test was performed as per KDB 558074, section 8.4 with reference to ANSI C63.10 subclause 11.10. The test was performed using method PKPSD (peak PSD).

Spectrum analyser settings:

 Resolution bandwidth:
 100 kHz

 Video bandwidth:
 ≥3 × RBW

 Frequency span:
 1.5 times the DTS BW (Peak)

Detector mode: Peak
Trace mode: Max hold
