

## Declaration

In respect to the CPE Part Number: CPE-O-R-WS and FCC ID: XYMCPETVWS-1  
Runcom declares as follows:

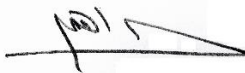

### 1- TPC ( Transmit Power Control) issue.

The CPE includes a Transmit Power Control mechanism that automatically adjusts the output power in line with the range to the Base station and the received signal strength at the Base Station . This mechanism limits the operating power to the minimum necessary for successful communication. The Base station measures the range to the CPE and its signal strength and provides a control signal to the CPE that sets the applicable output power for the specific situation. This process of updating the CPE transmit power is repeated every 5 milliseconds.

### 2- Part 15.709 Power limit test.

Since the Database will allocate to the product TVWS Channels according to the 30dBm conducted power, all Power limits shall be referenced to the 30dBm conducted power limits.
