

DESCRIPTION

When receiving module received the alert signals, it will send back to main chip (STC89C52RC),

the main chip spots the alert signals and controls three parts:

1. Starting the pronunciation alarm chip after amplifier alarm sound acoustics.
2. Control lamp boards display the path of alert.
3. Control dial-up circuit and dial-up the outside line.

Perimeter layout/removal functions by 9170 IC identify and decoding, dial-up outside line will complete by 9200 IC code.

When you want to record, you must open the S1 switch to the recording key, then click recording again.
