David Johanson RF/ EMC Test Engineer

Tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with CFR 47 FCC Part 2 Subpart J Section 2.1043, Industry Canada RSS 210 Issue 8, Industry Canada RSS-Gen Issue 3, & Industry Canada RSP-100 Issue 9: Changes in Certified Equipment for Licence-Exempt Radio Apparatus & Intentional Radiators Operating within the Band 2400-2483.5 MHz. The manufacturer is responsible for the tested product configuration, continued product compliance with these standards listed, and for the appropriate auditing of subsequent products as required.

EUT Cabling Configuration

Description	Number of Lines	Length (m)	Connection Type	Load or Termination	Shielded	Ferrites
DC Power Supply to EUT	2	10	Solder	Yes	No	At chamber Interface.

Note: Laptop, Ethernet switch and Ember unit were used to set the channel, continuous mode and modulation settings and were not present during the testing.

Product Description

The NCZ-3014 garage door sensor solution combines the features of an orientation sensor and ZigBee (802.15.4) radio in a single tiny device. Packed with intelligent features, the Garage Door Sensor expands Control4's network possibilities, reporting the open/closed state of a garage door, and all without any wires. Devices can be paired to indicate Fully Open, Fully Closed, and Ajar states.

EUT Testing Configuration

For the purpose of compliance testing, the EUT was powered using an auxiliary 3 VDC power supply since the battery would not have enough power to complete the testing. The EUT was programmed to transmit the maximum output power at the low, mid and high channels of the ZigBee band (2405, 2440 and 2480 MHz respectively) in a continuous transmission mode, with modulation. Programming was done by using an Ember programming module that was connected to a PC via POE Ethernet. The programming module was disconnected after programming and all auxiliary equipment was removed from the test area.

Section III: Requirements for the Canadian Market – Industry Canada

Summary for RSS-Gen Issue 3, RSS-210 Issue 8 & RSP-100 Issue 9 Class II Permission Change Requirements

Testing was performed pursuant to Industry Canada standards. For the purpose of verifying compliance for a Class II Permissive Change the radiated emissions were verified to ensure compliance. It was noted that there has been a sensor change compared to the previous version of this product. There was no change to the radio circuitry.

Test	Standard	Description	Result
Digital Circuits Radiated Emissions	RSS-Gen (7.1.4) ICES-003	The radiated emissions are measured in the 30-1000MHz range	Complies
Radiated Peak Power and Harmonics	RSS-210 (A2.9)(a)	Peak Power and Harmonics shall be measured at 3meters	Complies
Spurious Emissions outside of the band	RSS-210 (A2.9)(b)	Radiated Spurious emissions shall be 50dBc or 54dBuV in accordance with table 2, whichever is less stringent 30-18000MHz	Complies

Digital Circuits Radiated Emission Testing

DATE: January 18th, 2013

TEST STANDARD: ICES-003 Issue 5

TEST METHOD: RSS-Gen (7.1.4)

TEST VOLTAGE: 3 VDC

MINIMUM STANDARD: Class B Limit:

Frequency (MHz)	Maximum Field Strength (calculated) dB μ V/m at 3 m	Maximum Field Strength dB μ V/m at 10 m
30 - 230	40.45	30.0
230 - 1000	47.45	37.0

Note 1. The lower limit shall apply at the transition frequency
Note 2. Additional provisions may be required for cases where interference occurs
Note 3. The 3meter calculation is done for measurements performed at 3meters.

METHOD OF MEASUREMENT: The equipment was set up in 3m Semi Anechoic Chamber for preliminary and final measurements; Radiated Emissions were performed at 3 meters for this unit. A typical application was tested.

Emissions in both horizontal and vertical polarizations were measured while rotating the EUT on a turntable to maximize the emissions signal strength.

The EUT was investigated in 3 orthogonal planes and the worst case data and plots were taken.

The transmitter was set to continuous mode of transmission and modulation on for this test. The transmitter was tested in its low, mid, and high channels within the band.

MODIFICATIONS: The EUT did not require any modifications.

MEASUREMENT DATA: The plots and data are contained in Appendix A.

PERFORMANCE: Complies.

Radiated Peak Power of the Fundamental and Harmonics

DATE: January 22nd, 2013 & January 23rd, 2013

TEST STANDARD: RSS-210 Annex 2 Section (A2.9)(a)

TEST VOLTAGE: 3 VDC

MINIMUM STANDARD: (a) The field strengths measured at 3 meters shall not exceed the following:

Fundamental Frequency (MHz)	Field Strength (millivolts/m)	
	Fundamental	Harmonics
2400-2483.5	50 (94 dBuV)	0.5 (54 dBuV)

TEST SETUP: The EUT was tested in our 3meter SAC and was positioned on the center of the Turntable and connected to a 3 VDC power supply. The Transmitter was set for Continuous transmission. The lowest, middle and highest channels in the 2400-2483.5MHz band were measured for all radiated emissions 9kHz to 18 GHz in three orthogonal planes

MEASUREMENT METHOD: Measurements were made using an EMI Receiver with a 1 MHz RBW and average detector above 1 GHz as required and using the appropriate antennas, amplifiers and filters. The EUT was investigated in 3 orthogonal planes and the worst case data and plots were taken.

DEVICE DESCRIPTIONS: As described in the above EUT description and setup Section.

EMISSIONS DATA: See data in Appendix A.

OBSERVATIONS: The EUT performed as expected.

PERFORMANCE: Complies.

Spurious Radiated Emissions Testing

DATE: January 22nd, 2013 & January 23rd, 2013

TEST STANDARD: RSS-210 Annex 2 Section (A2.9)(b)
RSS-Gen Section (7.2.5)

TEST VOLTAGE: 3 VDC

MINIMUM STANDARD: (b) Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general field strength limits listed in RSS-Gen, whichever is less stringent.

General Field Strength Limits for Transmitters at Frequencies above 30 MHz

Frequency (MHz)	Field Strength	
	uV/m @ 3-m	Calculated dB μ V/m at 3m
30 - 88	100	40.0
88 - 216	150	43.5
216 - 960	200	46.0
960 +	500	54.0

TEST SETUP: The EUT was tested in a 3 meter semi-anechoic chamber and was positioned in the center of the turntable and connected to a 3 VDC power supply. The transmitter was set for continuous transmission. The lowest, middle and highest channels in the 2400-2483.5MHz band were measured for all radiated emissions 30 MHz to 18 GHz.

MEASUREMENT METHOD: Measurements were made using an EMI Receiver with a 120 kHz RBW and a quasi-peak detector below 1 GHz and with a 1 MHz RBW and average detector above 1 GHz as required and using the appropriate antennas, amplifiers and filters. The EUT was investigated in 3 orthogonal planes and the worst case data and plots were taken.

DEVICE DESCRIPTIONS: As described in the above EUT description and setup Section.

EMISSIONS DATA: See data in Appendix A

OBSERVATIONS: The EUT performed as expected.

PERFORMANCE: Complies.

Section IV: Requirements for the US Market - FCC

For the purpose of verifying compliance for a Class II Permissive Change the radiated emissions were verified to ensure compliance. It was noted that there has been a sensor change compared to the previous version of this product. There was no change to the radio circuitry.

Tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with FCC CFR 47 Part 15 Subpart C – Intentional Radiators

Summary for FCC CFR 47, Part 15 Subpart C Section 15.249

Test	Standard	Description	Result
Digital Circuits Radiated Emissions	15.249(d)	The radiated emissions are measured in the 30-18000MHz range	Complies
Radiated Fundamental and Harmonics Emissions	15.249(a)	Peak Fundamental and Harmonics shall be measured at 3meters	Complies
Spurious Emissions outside of the band and Bandedge	15.249(d) and (e)	Radiated Spurious emissions shall be 50dBc or the levels in 15.209	Complies

Digital Circuits Radiated Emission Testing

DATE: January 18th, 2013

TEST STANDARD: FCC Part 15 Subpart C Section 15.249(d)

TEST VOLTAGE: 3 VDC

MINIMUM STANDARD: Class B Limit:

Frequency (MHz)	Field Strength	
	uV/m @ 3-m	dB μ V/m at 3m
30 - 88	100	40.0
88 - 216	150	43.5
216 - 960	200	46.0
960 - 1000	500	54.0

METHOD OF MEASUREMENT: The equipment was set up in 3m Semi Anechoic Chamber for preliminary and final measurements; Radiated Emissions were performed at 3 meters for this unit. A typical application was tested.

Emissions in both horizontal and vertical polarizations were measured while rotating the EUT on a turntable to maximize the emissions signal strength.

The EUT was investigated in 3 orthogonal planes and the worst case data and plots were taken.

The transmitter was set to continuous mode of transmission and modulation on for this test. The transmitter was tested in its low, mid, and high channels within the band.

MODIFICATIONS: The EUT did not require any modifications.

MEASUREMENT DATA: See Appendix A for emissions plots and corresponding data

PERFORMANCE: Complies.

Radiated Peak Power of the Fundamental and Harmonics

DATE: January 22nd, 2013 & January 23rd, 2013

TEST STANDARD: CFR 47 FCC Part 15 Subpart C Section 15.249(a)

TEST VOLTAGE: 3 VDC

MINIMUM STANDARD: (a) The field strengths measured at 3 meters shall not exceed the following:

Fundamental Frequency (MHz)	Field Strength (millivolts/m)	
	Fundamental	Harmonics
2400-2483.5	50 (94 dBuV)	0.5 (54 dBuV)

TEST SETUP: The EUT was tested in our 3meter SAC and was positioned on the center of the Turntable and connected to a 3 VDC power supply. The Transmitter was set for Continuous transmission. The lowest, middle and highest channels in the 2400-2483.5MHz band were measured for all radiated emissions 9kHz to 18 GHz in three orthogonal planes

MEASUREMENT METHOD: Measurements were made using an EMI Receiver with a 1 MHz RBW and average detector above 1 GHz as required and using the appropriate antennas, amplifiers and filters. The EUT was investigated in 3 orthogonal planes and the worst case data and plots were taken.

DEVICE DESCRIPTIONS: As described in the above EUT description and setup Section.

EMISSIONS DATA: See data in Appendix A.

OBSERVATIONS: The EUT performed as expected.

PERFORMANCE: Complies.

Spurious Radiated Emissions and Bandedge Testing

DATE: January 22nd, 2013 & January 23rd, 2013

TEST STANDARD: FCC Part 15.249(d) & (e).

TEST VOLTAGE: 3 VDC

MINIMUM STANDARD: (d) Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in § 15.209, whichever is the lesser attenuation.
(e) As shown in § 15.35(b), for frequencies above 1000 MHz, the field strength limits in paragraphs (a) and (b) of this section are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20dB under any condition of modulation.

15.209 General Field Strength Limits

Frequency (MHz)	Field Strength	
	uV/m @ 3-m	Calculated dB μ V/m at 3m
30 – 88	100	40.0
88 – 216	150	43.5
216 – 960	200	46.0
960 +	500	54.0

TEST SETUP: The EUT was tested in a 3 meter semi-anechoic chamber and was positioned in the center of the turntable and connected to a 3 VDC power supply. The transmitter was set for continuous transmission. The lowest, middle and highest channels in the 2400-2483.5MHz band were measured for all radiated emissions 30 MHz to 18 GHz.

MEASUREMENT METHOD: Measurements were made using an EMI Receiver with a 120 kHz RBW and a quasi-peak detector below 1 GHz and with a 1 MHz RBW and average detector above 1 GHz as required and using the appropriate antennas, amplifiers and filters. The EUT was investigated in 3 orthogonal planes and the worst case data and plots were taken.

DEVICE DESCRIPTIONS: As described in the above EUT description and setup section.

EMISSIONS DATA: See data in Appendix A

OBSERVATIONS: The EUT performed as expected.

PERFORMANCE: Complies.
