

RADIO TEST REPORT

REP035703

Date of issue: May 15, 2024

Applicant:

Radio Activity Srl

Via Privata Cascia, 11 – 20128 Milano (MI) – Italy

Product:

Multi-protocol analog and digital transceiver

Model:

KA-500e

FCC ID:

Y9M-KA500E

Specifications:

- FCC 47 CFR Part 22, Subpart C and E
- FCC 47 CFR Part 90, Subpart I

Section 1 Report summary

1.1 Test specifications

| FCC 47 CFR Part 90, Subpart I | Private land mobile radio services. General technical standards |
|-------------------------------|---|
| FCC 47 CFR Part 22, Subpart C | Public Mobile Services. Operational and Technical Requirements |
| FCC 47 CFR Part 22, Subpart E | Public Mobile Services. Paging and Radiotelephone Service |

1.2 Test methods

| ANSI C63.26-2015 | American National Standard for Compliance Testing of Transmitters Used in Licensed Radio Services |
|------------------------------|---|
| FCC 47 CFR Part 2, Subpart J | Equipment authorization procedures |

1.3 Exclusions

None

1.4 Statement of compliance

In the configuration tested, the EUT was found compliant.

Testing was performed against all relevant requirements of the test standard except as noted in section 1.3 above. Results obtained indicate that the product under test complies In full with the requirements tested. The test results relate only to the items tested.

See "Summary of test results" for full details.

1.5 Test report revision history

| None | |
| 2.3 | Deviations from laboratory tests procedures |
| | |

No deviations were made from laboratory procedures.

Section 3 Test conditions

| 2 4 | A 4 | - !! - | |
|-----|--------|--------|------------|
| 3.1 | Atmosi | oneric | conditions |

In the laboratory, the following ambient conditions are respected for each test reported below:

Ambient temperature: 18 \div 33 °C $^{(1)}$

Relative Humidity: $25 \div 70 \%$ (2)

Atmospheric pressure: 860 ÷ 1060 hPa

The following instruments are used to monitor the environmental conditions:

| Equipment | Manufacturer | Model | Serial N° |
|--------------------------------|--------------|----------|--------------|
| Thermo-hygrometer data loggers | Testo | 175-H2 | 20012380/305 |
| Thermo-hygrometer data loggers | Testo | 175-H2 | 38203337/703 |
| Barometer | Castle | GPB 3300 | 072015 |

3.2 Power supply range

The normal test voltage for equipment to be connected to the mains shall be the nominal mains voltage. For the purpose of the present document, the nominal voltage shall be the declared voltage, or any of the declared voltages ±5 %, for which the equipment was designed.

Report reference ID: REP035703

Section 4 Measurement uncertainty

4.1 Uncertainty of measurement

The measurement uncertainty was calculated for each test and quantity listed in this test report, according to CISPR 16-4-2, ETSI TR 100 028-1, ETSI TR 100 028-2 and other specific test standards and is documented in Nemko Spa working manuals WML1002 and WML0078.

The assessment of conformity for each test performed on the equipment is performed not taking into account the measurement uncertainty. The two following possible verdicts are stated in the report:

P (Pass) - The measured values of the equipment respect the specification limit at the points tested. The specific risk of false accept is up to 50% when the measured result is close to the limit.

F (Fail) - One or more measured values of the equipment do not respect the specification limit at the points tested. The specific risk of false reject is up to 50% when the measured result is close to the limit.

Hereafter Nemko's measurement uncertainties are reported:

| EUT | Туре | Test | Range | Measurement Uncertainty | Notes |
|-------------|---|---|----------------------|----------------------------|-------|
| | | Frequency error | 0.001 MHz ÷ 40 GHz | 0.08 ppm | (1) |
| | | 0.009 MHz ÷ 30 MHz | 1.1 dB | (1) | |
| | | Carrier power | 30 MHz ÷ 18 GHz | 1.5 dB | (1) |
| | | RF Output Power | 18 MHz ÷ 40 GHz | 3.0 dB | (1) |
| | | | 40 MHz ÷ 140 GHz | 5.0 dB | (1) |
| | | Adjacent channel power | 1 MHz ÷ 18 GHz | 1.4 dB | (1) |
| | | | 0.009 MHz ÷ 18 GHz | 3.0 dB | (1) |
| | | Conducted spurious emissions | 18 GHz ÷ 40 GHz | 4.2 dB | (1) |
| | | | 40 GHz ÷ 220 GHz | 6.0 dB | (1) |
| | | Intermodulation attenuation | 1 MHz ÷ 18 GHz | 2.2 dB | (1) |
| | | Attack time – frequency behaviour | 1 MHz ÷ 18 GHz | 2.0 ms | (1) |
| | | Attack time – power behaviour | 1 MHz ÷ 18 GHz | 2.5 ms | (1) |
| | Conducted | Release time – frequency behaviour | 1 MHz ÷ 18 GHz | 2.0 ms | (1) |
| | Transmitter | Release time – power behaviour | 1 MHz ÷ 18 GHz | 2.5 ms | (1) |
| Transmittar | | Transient behaviour of the transmitter– Transient frequency behaviour | 1 MHz ÷ 18 GHz | 0.2 kHz | (1) |
| Transmitter | | Transient behaviour of the transmitter – Power level slope | 1 MHz ÷ 18 GHz | 9% | (1) |
| | Frequency deviation - Maximum permissible frequency deviation | 0.001 MHz ÷ 18 GHz | 1.3% | (1) | |
| | | Frequency deviation - Response of the transmitter to modulation frequencies above 3 kHz | 0.001 MHz ÷ 18 GHz | 0.5 dB | (1) |
| | | Dwell time | - | 3% | (1) |
| | | Hopping Frequency Separation | 0.01 MHz ÷ 18 GHz | 1% | (1) |
| | | Occupied Channel Bandwidth | 0.01 MHz ÷ 18 GHz | 2% | (1) |
| | | Modulation Bandwidth | 0.01 MHz ÷ 18 GHz | 2% | (1) |
| | | | 0.009 MHz ÷ 26.5 GHz | 6.0 dB | (1) |
| | | Radiated spurious emissions | 26.5 GHz ÷ 66 GHz | 8.0 dB | (1) |
| | Da diata d | | 66 GHz ÷ 220 GHz | 10 dB | (1) |
| | Radiated | | 10 kHz ÷ 26.5 GHz | 6.0 dB | (1) |
| | | Effective radiated power transmitter | 26.5 GHz ÷ 66 GHz | 8.0 dB | (1) |
| | | | 66 GHz ÷ 220 GHz | 10 dB | (1) |

NOTES:

(1) The reported expanded uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k = 2, which for a normal distribution corresponds to a coverage probability of approximately 95 %

Section 7 Testing data

7.1 Number of frequencies

7.1.1 References, definitions and limits

ANSI C63.26, Clause 5.1.2:

Measurements of transmitters shall be performed and, if required, reported for each frequency band in which the EUT can be operated with the device transmitting at the number of frequencies in each band specified in table below.

Table 7.1-1: Frequency Range of Operation

| Frequency range over which the device | | Location of measurement frequency inside the |
|---------------------------------------|-------------------------------------|---|
| operates (in each band) | Number of test frequencies required | operating frequency range |
| 1 MHz or less | 1 | Center (middle of the band) |
| 1–10 MHz | 2 | 1 near high end, 1 near low end |
| Greater than 10 MHz | 3 | 1 near high end, 1 near center and 1 near low end |

Notes: "near" means as close as possible to or at the centre / low end / high end of the frequency range over which the device operates.

7.1.2 Test summary

| Verdict | Pass | | |
|-----------|---------|-----------|----------------|
| Tested by | O. Frau | Test date | March 25, 2024 |

7.1.3 Observations, settings and special notes

None

7.2 Modulation characteristic

7.2.1 References, definitions and limits

FCC §2.1047:

- (a) Voice modulated communication equipment. A curve or equivalent data showing the frequency response of the audio modulating circuit over a range of 100 to 5000 Hz shall be submitted. For equipment required to have an audio low-pass filter, a curve showing the frequency response of the filter, or of all circuitry installed between the modulation limiter and the modulated stage shall be submitted.
- (b) Equipment which employs modulation limiting. A curve or family of curves showing the percentage of modulation versus the modulation input voltage shall be supplied. The information submitted shall be sufficient to show modulation limiting capability throughout the range of modulating frequencies and input modulating signal levels employed

7.2.2 Test summary

| Verdict | Pass | | |
|-----------|---------|-----------|----------------|
| Tested by | O. Frau | Test date | April 09, 2024 |

7.2.3 Observations, settings and special notes

Per ANSI C63.26 Subclause 5.3.1: The audio frequency response is the degree of closeness to which the frequency deviation of the transmitter follows a prescribed characteristic.

Spectrum analyser settings:

| Receiver mode | RMS deviation |
|---------------------------|--------------------|
| Audio frequency generator | 100 Hz and 5000 Hz |

Reference voltage measurement: Apply a 1000 Hz tone and adjust the audio frequency generator to produce 20% of the rated system deviation. Record the DMM reading as V_{REF}.

Calculation of the audio frequency response at the present frequency: $20 \times Log_{10}$ (V_{FREQ} / V_{REF})

Per ANSI C63.26 Subclause 5.3.2: Modulation limiting is the ability of a transmitter circuit to limit the transmitter from producing deviations in excess of a rated system deviation.

Spectrum analyser settings:

tone

| Receiver mode | Peak positive and negative deviation |
|---------------------------|--------------------------------------|
| Audio frequency generator | 300 Hz, 2500 Hz and 3000 Hz |
| tone | |

Reference voltage measurement: Apply a 1000 Hz tone and adjust the audio frequency generator to produce 60% of the rated system deviation. This is the 0 dB reference level. Plot the data set as a percentage of deviation relative to the 0 dB reference point versus input voltage.

7.2.4 Test equipment list

7.2.5 Test data

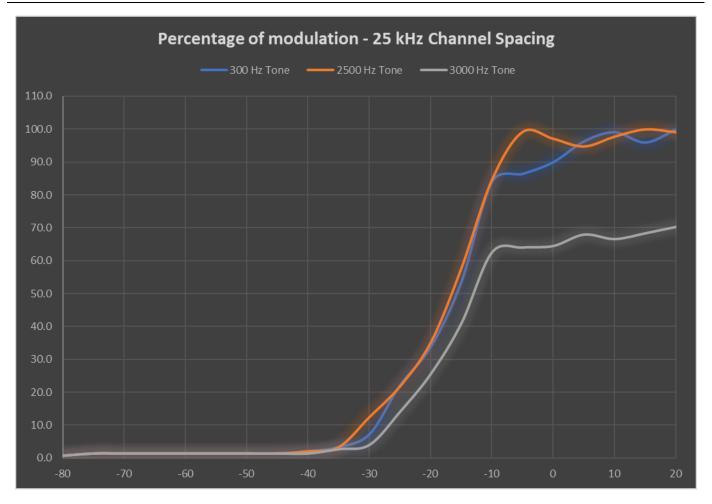

Modulation Limiting at 481.0 MHz (12.5 kHz)

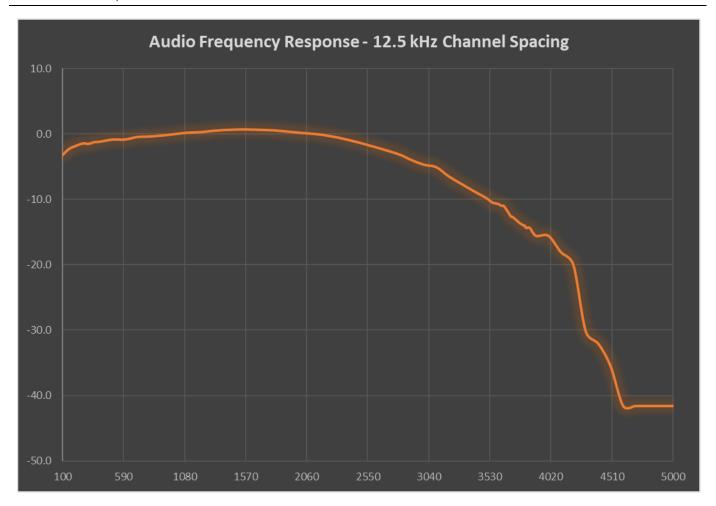

Modulation Limiting at 481.0 MHz (25 kHz)

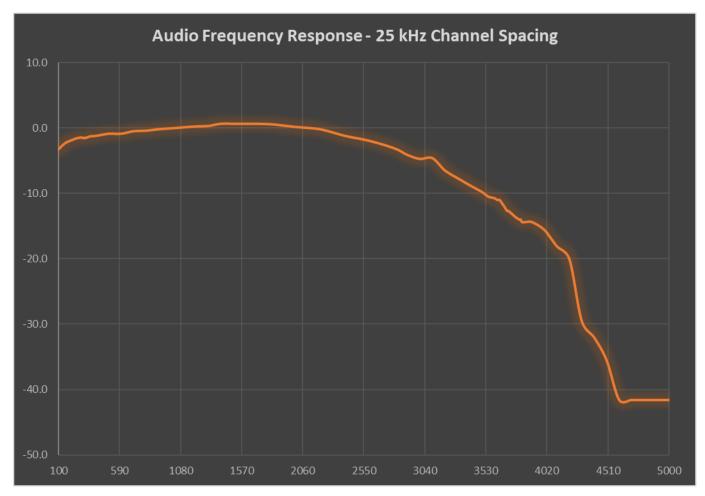

Audio frequency response at 481.0 MHz (12.5 kHz)

Audio frequency response at 481.0 MHz (25 kHz)

7.3 Transmitter Output Power

7.3.1 References, definitions and limits

FCC §22.565:

The transmitting power of base, mobile and fixed transmitters operating on the channels listed in § 22.561 must not exceed the limits in this section.

(a) Maximum ERP. The effective radiated power (ERP) of base and fixed transmitters must not exceed the applicable limits in this paragraph under any circumstances.

Table 7.3-1: Maximum ERP

| Frequency range (MHz) | Maximum ERP (watts) |
|-----------------------|---------------------|
| 152 – 153 | 1400 |
| 157 – 159 | 150 |
| 454 – 455 | 3500 |
| 459 – 460 | 150 |

- (b) Basic power limit. Except as provided in paragraph (d) of this section, the ERP of base transmitters must not exceed 500 Watts.
- (c) Height-power limits. Except as provided in paragraph (d) of this section, the ERP of base transmitters must not exceed the amount that would result in an average distance to the service contour of 41.6 kilometers (26 miles) for VHF channels or 30.7 kilometers (19 miles) for UHF channels. The average distance to the service contour is calculated by taking the arithmetic mean of the distances determined using the procedures specified in § 22.567 for the eight cardinal radial directions, excluding cardinal radial directions for which 90% or more of the distance so calculated is over water.
- (d) Encompassed interfering contour areas. Base transmitters are exempt from the basic power and height-power limits of this section if the area within their interfering contours is totally encompassed by the interfering contours of operating co-channel based transmitters controlled by the same licensee. For the purpose of this paragraph, operating transmitters are authorized transmitters that are providing service to subscribers.
- (e) Adjacent channel protection. The ERP of base and fixed transmitters must not exceed 500 Watts if they transmit on channel 454.025 MHz and are located less than 7 kilometers (4.3 miles) from any Private Radio Services station receiving on adjacent channel 454.0000 MHz.
- (f) Mobile transmitters. The transmitter output power of mobile transmitters must not exceed 60 watts.

FCC §90.205:

- (h) Power and antenna height limits within 450–470 MHz.
- (1) The maximum allowable station effective radiated power (ERP) is dependent upon the station's antenna HAAT and required service area and will be authorized in accordance with table below. Applicants requesting an ERP in excess of that listed in table below must submit an engineering analysis based upon generally accepted engineering practices and standards that includes coverage contours to demonstrate that the requested station parameters will not produce coverage in excess of that which the applicant requires.
- (2) Applications for stations where special circumstances exist that make it necessary to deviate from the ERP and antenna heights in Table below will be submitted to the frequency coordinator accompanied by a technical analysis, based upon generally accepted engineering practices and standards, that demonstrates that the requested station parameters will not produce a signal strength in excess of 39 dBu at any point along the edge of the requested service area. The coordinator may then recommend any ERP appropriate to meet this condition.
- (3) An applicant for a station with a service area radius greater than 32 km (20 mi) must justify the requested service area radius, which may be authorized only in accordance with table below, note 4. For base stations with service areas greater than 80 km, all operations 80 km or less from the base station will be on a primary basis and all operations outside of 80 km from the base station will be on a secondary basis and will be entitled to no protection from primary operations.

Service area radius (km):

|--|---|----|----|----|----|-----------------|-----------------|-----------------|-----------------|
| 3 | 8 | 13 | 16 | 24 | 32 | 40 ⁴ | 48 ⁴ | 64 ⁴ | 80 ⁴ |
| _ | | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 |

125

Notes: ¹Maximum ERP indicated provides for a 39 dBu signal strength at the edge of the service area per FCC Report R-6602, Fig. 29 (See §73.699, Fig. 10 b).

²Maximum ERP of 500 watts allowed. Signal strength at the service area contour may be less than 39 dBu. ³When the actual antenna HAAT is greater than the reference HAAT, the allowable ERP will be reduced in accordance with the following equation:

 $ERP_{allow} = ERP_{max} \times (HAAT_{ref} / HAAT_{actual})^2$.

⁴Applications for this service area radius may be granted upon specific request with justification and must include a technical demonstration that the signal strength at the edge of the service area does not exceed 39 dBu.

- (i) 470-512 MHz. Power and height limitations are specified in §§ 90.307 and 90.309.
- (r) All other frequency bands. Requested transmitter power will be considered and authorized on a case by case basis.
- (s) The output power shall not exceed by more than 20 percent either the output power shown in the Radio Equipment List [available in accordance with § 90.203(a)(1)] for transmitters included in this list or when not so listed, the manufacturer's rated output power for the particular transmitter specifically listed on the authorization.

7.3.2 Test summary

| Verdict | Pass | | |
|-----------|---------|-----------|----------------|
| Tested by | O. Frau | Test date | March 26, 2024 |

7.3.3 Observations, settings and special notes

Manufacturer's rated output power is 50 W or 47 dBm. 20% of the output power is 47.8 dBm

Measurement of peak power was performed per ANSI C63.26 subclause 5.2.3.3. Spectrum analyser settings:

| Resolution bandwidth | ≥ OBW |
|----------------------|---|
| Video bandwidth | ≥ 3 × RBW |
| Frequency span | ≥ 2 × OBW |
| Detector mode | Peak |
| Trace mode | Max Hold |
| Sweep time | ≥ 10 × (number of points in sweep) × (transmission symbol period) |

7.3.4 Test equipment list

Bandwidth limitations 7.4

7.4.1 References, definitions and limits

FCC §22.561:

The following channels are allocated for paired assignment to transmitters that provide (or support other transmitters that provide) one-way or twoway public land mobile service, either individually or collectively under a paging geographic area authorization. The paging geographic areas used for these channels are the EAs (see § 22.503(b)(3)). These channels may be assigned for use by mobile or base transmitters as indicated, and or by fixed transmitters (including control, repeater or other fixed transmitters). The mobile channels may also be assigned for use by base or fixed transmitters under certain circumstances (see § 22.567(h)). Unless otherwise indicated, all channels have a bandwidth of 20 kHz and are designated by their center frequencies in MegaHertz.

Table 7.4-1: UHF Channels

FCC §90.209:

Frequency band, MHz

- (b) The maximum authorized single channel bandwidth of emission corresponding to the type of emission specified in §90.207 is as follows:
- Unless specified elsewhere, channel spacings and bandwidths that will be authorized in the following frequency bands are given in the following table.

Table 7.4-2: Standard Channel Spacing/Bandwidth Channel spacing, kHz

| | 406-512 | 6.25 | 20 / 11.25 / 6 |
|-------|--|--|---|
| Note: | ¹ Operations using equipment designed to operat | e with a 25 kHz channel bandwidth will be auth | horized a 20 kHz bandwidth. Operations using equipment |
| | designed to operate with a 12.5 kHz channel band | dwidth will be authorized a 11.25 kHz bandwid | th. Operations using equipment designed to operate with a |
| | 6.25 kHz channel bandwidth will be authorized a | 6 kHz bandwidth. All stations must operate on | channels with a bandwidth of 12.5 kHz or less beginning |

January 1, 2013 (6)(i) Beginning January 1, 2011, no new applications for the 421-512 MHz bands will be acceptable for filing if the applicant utilizes channels with an

authorized bandwidth exceeding 11.25 kHz, unless specified elsewhere or the operations meet the efficiency standards of §90.203(j)(3).

7.4.2 Test summary

| Verdict | Pass | | |
|-----------|---------|-----------|----------------|
| Tested by | O. Frau | Test date | March 27, 2024 |

7.4.3 Observations, settings and special notes

The test was performed as per ANSI C63.26, subclause 5.4.4.

Spectrum analyser settings:

| Resolution bandwidth | 1–5% of OBW |
|----------------------|-------------|
| Video bandwidth | ≥3 × RBW |
| Frequency span | 1.5 × OBW |
| Detector mode | Peak |
| Trace mode | Max Hold |

7.5 Spectrum mask and spurious emissions

7.5.1 References, definitions and limits

FCC §22.359:

The rules in this section govern the spectral characteristics of emissions in the Public Mobile Services, except for the Air-Ground Radiotelephone Service (see § 22.861, instead) and the Cellular Radiotelephone Service (see § 22.917, instead).

- (a) Out of band emissions. The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43 + 10 log (P) dB.
- (i.e., 30 kHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.
- (c) Alternative out of band emission limit. Licensees in the Public Mobile Services may establish an alternative out of band emission limit to be used at specified frequencies (band edges) in specified geographical areas, in lieu of that set forth in this section, pursuant to a private contractual arrangement of all affected licensees and applicants. In this event, each party to such contract shall maintain a copy of the contract in their station files and disclose it to prospective assignees or transferees and, upon request, to the FCC.
- (d) Interference caused by out of band emissions. If any emission from a transmitter operating in any of the Public Mobile Services results in interference to users of another radio service, the FCC may require a greater attenuation of that emission than specified in this section.

FCC §90.210:

Except as indicated elsewhere in this part, transmitters used in the radio services governed by this part must comply with the emission masks outlined in this section. Unless otherwise stated, per paragraphs (d)(4), (e)(4), and (o) of this section, measurements of emission power can be expressed in either peak or average values provided that emission powers are expressed with the same parameters used to specify the unmodulated transmitter carrier power. For transmitters that do not produce a full power unmodulated carrier, reference to the unmodulated transmitter carrier power refers to the total power contained in the channel bandwidth. Unless indicated elsewhere in this part, the table in this section specifies the emission masks for equipment operating under this part.

Table 7.5-1: Applicable Emission Masks

| Frequency band, MHz | Mask for equipment with audio low pass filter | Mask for equipment with audio low pass filter |
|------------------------|---|---|
| 421–512 ^{1,2} | B, D, or E | C, D, or E |

Notes: ¹Equipment designed to operate with a 25 kHz channel bandwidth must meet the requirements of Emission Mask B or C, as applicable. Equipment designed to operate with a 12.5 kHz channel bandwidth must meet the requirements of Emission Mask D, and equipment designed to operate with a 6.25 kHz channel bandwidth must meet the requirements of Emission Mask E.

²Equipment designed to operate on 25 kilohertz bandwidth channels must meet the requirements of either Emission Mask B or G, whichever is applicable, while equipment designed to operate on 12.5 kilohertz bandwidth channels must meet the requirements of Emission Mask D. Equipment designed to operate on 25 kilohertz bandwidth channels may alternatively meet the Adjacent Channel Power limits of §90.221.

- (b) **Emission Mask B.** For transmitters that are equipped with an audio low-pass filter, the power of any emission must be attenuated below the unmodulated carrier power (P) as follows:
- (1) On any frequency removed from the assigned frequency by more than 50 percent, but not more than 100 percent of the authorized bandwidth: At least 25 dB.
- (2) On any frequency removed from the assigned frequency by more than 100 percent, but not more than 250 percent of the authorized bandwidth: At least 35 dB.
- (3) On any frequency removed from the assigned frequency by more than 250 percent of the authorized bandwidth: At least 43 + 10 log (P) dB.

- (c) Emission Mask C. For transmitters that are not equipped with an audio low-pass filter, the power of any emission must be attenuated below the unmodulated carrier output power (P) as follows:
- (1) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 5 kHz, but not more than 10 kHz: At least 83 log (f_d/5) dB;
- (2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 10 kHz, but not more than 250 percent of the authorized bandwidth: At least 29 log ($f_d^2/11$) dB or 50 dB, whichever is the lesser attenuation;
- (3) On any frequency removed from the center of the authorized bandwidth by more than 250 percent of the authorized bandwidth: At least 43 + 10 log (P) dB.
- (d) **Emission Mask D**—12.5 kHz channel bandwidth equipment. For transmitters designed to operate with a 12.5 kHz channel bandwidth, any emission must be attenuated below the power (P) of the highest emission contained within the authorized bandwidth as follows:
- (1) On any frequency from the center of the authorized bandwidth f_0 to 5.625 kHz removed from f_0 : Zero dB.
- (2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (fd in kHz) of more than 5.625 kHz but no more than 12.5 kHz: At least 7.27(fd-2.88 kHz) dB.
- (3) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (fd in kHz) of more than 12.5 kHz: At least 50 + 10 log (P) dB or 70 dB, whichever is the lesser attenuation.
- (4) The reference level for showing compliance with the emission mask shall be established using a resolution bandwidth sufficiently wide (usually two or three times the channel bandwidth) to capture the true peak emission of the equipment under test. In order to show compliance with the emission mask up to and including 50 kHz removed from the edge of the authorized bandwidth, adjust the resolution bandwidth to 100 Hz with the measuring instrument in a peak hold mode. A sufficient number of sweeps must be measured to insure that the emission profile is developed. If video filtering is used, its bandwidth must not be less than the instrument resolution bandwidth. For emissions beyond 50 kHz from the edge of the authorized bandwidth, see paragraph (o) of this section. If it can be shown that use of the above instrumentation settings do not accurately represent the true interference potential of the equipment under test, an alternate procedure may be used provided prior Commission approval is obtained.
 - (e) **Emission Mask E**—6.25 kHz or less channel bandwidth equipment. For transmitters designed to operate with a 6.25 kHz or less bandwidth, any emission must be attenuated below the power (P) of the highest emission contained within the authorized bandwidth as follows:
 - (1) On any frequency from the center of the authorized bandwidth f_0 to 3.0 kHz removed from f_0 : Zero dB.
 - (2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 3.0 kHz but no more than 4.6 kHz: At least 30 + 16.67(f_d -3 kHz) or 55 + 10 log (P) or 65 dB, whichever is the lesser attenuation.
 - (3) On any frequency removed from the center of the authorized bandwidth by more than 4.6 kHz: At least 55 + 10 log (P) or 65 dB, whichever is the lesser attenuation.
 - (4) The reference level for showing compliance with the emission mask shall be established using a resolution bandwidth sufficiently wide (usually two or three times the channel bandwidth) to capture the true peak emission of the equipment under test. In order to show compliance with the emission mask up to and including 50 kHz removed from the edge of the authorized bandwidth, adjust the resolution bandwidth to 100 Hz with the measuring instrument in a peak hold mode. A sufficient number of sweeps must be measured to insure that the emission profile is developed. If video filtering is used, its bandwidth must not be less than the instrument resolution bandwidth. For emissions beyond 50 kHz from the edge of the authorized bandwidth, see paragraph (o) of this section. If it can be shown that use of the above instrumentation settings do not accurately represent the true interference potential of the equipment under test, an alternate procedure may be used provided prior Commission approval is obtained.
