1. Summary of test results

The test results apply exclusively to the test samples as presented in this report. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests. Also we refer on special conditions which the applicant should fulfill according §2.927 to §2.948, special focus regarding modification of the equipment and availability of sample equipment for market surveillance tests.
The presented Equipment Under Test (in this report, hereinafter referred as EUT) integrates a Bluetooth© FHSS transmitter. Other implemented wireless technologies are not considered within this test report.

Following test cases have been performed to sow compliance with applicable FCC Part 2 and Part 15 rules of the US CFR Title 47 Rules, Edition 2017.

1.1. Tests overview of US CFR (FCC) Standards

Test cases	Port	References and Limits		EUT set-up	EUT op. mode	Result
		FCC Standard	Test limit			
TX-Mode						
20 dB bandwidth	Antenna terminal (conducted)	§15.247 (a)(1)	At least 25 kHz or 2/3 of 20 dB bandwith	2	1	passed
Channel carrier frequency separation				2	2	
99% occupied bandwidth	Antenna terminal (conducted)	2.1049(h)	99% Power bandwidth	2	1	passed
Channel use, average channel use, input band-width and synchronization between signals	--	§15.247 (a)(1)	See specification	--	--	not performed
Channel average Occupancy time and number of channels	Antenna terminal (conducted)	§15.247 (a)(1) (iii)	0.4 seconds	2	2	passed
Transmitter Peak output power	Antenna terminal (conducted)	§15.247 (b)(1)	< 125 mW	2	1	passed
Transmitter frequency stability	Antenna terminal (conducted)	--	Operation within designated operational band	--	--	Not tested
Transmitter Peak output power radiated	Enclosure (radiated)	§15.247 (b)(4)	< 125 mW (EIRP) for antenna with directional gain less 6 dBi	--	--	passed

Out-Of-Band RF-emissions Band-Edge emissions	Antenna terminal (conducted)	§15.247 (d)	20 dBc and Emissions in restricted bands must meet the general field strength radiated limits	2	1 + 2	passed
General field strength emissions + restricted bands	Enclosure + Interconnecting cables (radiated)	§15.247 (d) §15.205 §15.209	Emissions in restricted bands must meet the general field-strength radiated limits	1	1	passed
AC-Power Lines Conducted Emissions	AC-Power lines	§15.207	FCC §15.107 class B limits §15.207 limits	--	--	Not applicable

Remark:

The current version of the Test Report CETECOM_TR18-1-0010801T01a-C1 replaces the test report CETECOM_TR18-1-0010801T01a dated 2018-10-24. The replaced test report is herewith invalid.

2. Administrative Data

2.1. Identification of the testing laboratory

Company name:	CETECOM GmbH
Address:	Im Teelbruch 116 45219 Essen - Kettwig Germany
Responsible for testing laboratory:	Dipl.-Ing. Niels Jeß

2.2. Test location

2.2.1. Test laboratory “CTC”

Company name:	see chapter 2.1. Identification of the testing laboratory

2.3. Organizational items

Responsible for test report and project leader:	B.Sc. Mohamed Ahmed
Receipt of EUT:	2018-08-20
Date(s) of test:	2018-08-20, 2018-10-15
Date of report:	2018-12-10
Version of template: 13.02	

2.4. Applicant’s details

Applicant’s name:	Robert Bosch Car Multimedia GmbH
Address:	Robert-Bosch-Straße 200 31139 Hildesheim Germany
Contact person:	Mr. Thomas Dargel

2.5. Manufacturer’s details

Manufacturer’s name:	please see Applicant's details
Address:	please see Applicant's details

3. Equipment under test (EUT)

3.1. Technical data of main EUT declared by applicant

Main function	Radio with Bluetooth
Type	1-DIN TCC MID
Frequency range and channels (US/Canada -bands)	2402 MHz to 2480 MHz ☒ Ch. 0 to Ch. 78 ☐ Ch. 0 to Ch. 40
Type of modulation (packet types)	☒ BT 1.0 / BT 1.1: DH1/DH3/DH5 – GFSK ☒ BT 2.0 / BT 2.1: DH1/2DH3/2DH5 – Pi/4 DQPSK ☒ BT 3.0: 3DH1/3DH3/3DH5 – 8DPSK ☐ BT 4.0: DH1/DH3/DH5 – GFSK
Number of channels (USA/Canada -bands)	☒ 0 to 78 ☐ 0 to 40
Module	UGZZ8-7A0B
Antenna Type	☒ Integrated ☐ External, no RF- connector ☐ External, separate RF-connector
Antenna Gain	Maximum 1.6 dBi gain
MAX Field strength (radiated):	94.985 dBµV/m@3m distance on nominal 2441 MHz
FCC-ID	YBN-1DINTCCMID0
Installed options	☒ Bluetooth©wireless technologies ☒ FM-Radio (Receiver only)
Power supply	☐ Internal battery Li-Io, range 3.5V to 4.1 V ☐ over AC/DC adapter: 110V/60 Hz ☒ DC power only: 24 Volt
Special EMI components	--
EUT sample type	☐ Production ☒ Pre-Production ☐ Engineering
Firmware	☐ for normal use ☒ Special version for test execution
FCC label attached	☐ yes ☒ no

3.2. EUT: Type, S/N etc. and short descriptions used in this test report

Short descrip-tion*)	EUT	Type	Sample Nr.	S/N serial number	HW hardware status	SW software status
EUT A	1-DIN TCC MID (radiated sample)	Radio with Bluetooth	S03	078000001648	18/20	0401
EUT B	1-DIN TCC MID (conducted sample)	Radio with Bluetooth	S04	078000001563	18/20	0401

*) EUT short description is used to simplify the identification of the EUT in this test report.

3.3. Auxiliary Equipment (AE): Type, S/N etc. and short descriptions

AE short descrip-tion *)	Auxiliary Equipment	Type	S/N serial number	HW hardware status	SW software status
AE 1	Main Cable Harness	-	-	-	-
AE 2	USB to UART cable	-	-	-	-
AE 3	Dell Notebook (ctc522013)	Latitude E6430	GB3WXY1	Intel Core I5	Windows 7 Professional (64bit)

*) AE short description is used to simplify the identification of the auxiliary equipment in this test report.

3.4. EUT set-ups

EUT set-up no.*)	Combination of EUT and AE	Remarks
set. 1	EUT A + AE1 + (AE2 + AE3) AE2 and AE3 only used to set the TX Mode	Radiated measurements
set. 2	EUT B + AE1 + (AE2 + AE3) AE2 and AE3 only used to set the TX Mode	Conducted measurements

*) EUT set-up no. is used to simplify the identification of the EUT set-up in this test report.

3.5. EUT operating modes

EUT operating mode no.*)	Description of operating modes	Additional information
op. 1	Bluetooth FHSS Modes* TX-Fixed Channel (Modulated)	For Bluetooth BR & EDR Modes tests are carried out with different Channels | Modulation | Data Rate Combinations with help of special test software. The EUT was put to **Fixed Channel (Modulated) Continuous transmissions mode.** **(Channel Type | Frequency | Power Settings)** **Lowest Channel : 0 : 2402 MHz | Power : +4 dBm** **Middle Channel :39: 2441 MHz | Power : +4 dBm** **Highest Channel :78: 2480 MHz | Power : +4 dBm** *Other supported wireless technologies were put in idle mode using special test software Bluetest3
op. 2	Bluetooth FHSS TX- Hopping	With help of special test software, continuous TX traffic mode could be established. - Frequency Hopping : ON -

*) EUT operating mode no. is used to simplify the test report.

3.6. Test Software

CSR BlueTest3 Software Version 2.5.8 was used. On Test Laptop ctc522013

See below the Modulation and packet types that were set in the Software.

Modulation	Packet Type	Remarks
GFSK	DH1, DH3, DH5	(Basic Data Rate)
π/4DQPSK	2-DH1, 2-DH3, 2-DH5	(Enhanced Data Rate)
8DPSK	3-DH1, 3-DH3, 3-DH5	(Enhanced Data Rate)
Packet type	**Setting packet type**	
DH1	Packet Type = 4, Size = 27	
2-DH1	Packet Type = 20, Size = 54	
3-DH1	Packet Type = 24, Size = 83	
DH3	Packet Type = 11, Size = 183	
2-DH3	Packet Type = 26, Size = 367	
3-DH3	Packet Type = 27, Size = 552	
DH5	Packet Type = 15, Size = 339	
2-DH5	Packet Type = 30, Size = 679	
3-DH5	Packet Type = 31, Size = 1021	

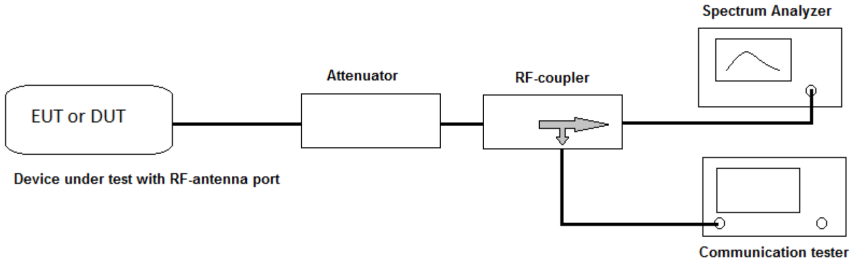
4. Description of test system set-up's

4.1. Test system set-up for conducted RF-measurements at antenna port

Specification: ANSI C63.10-2013

General Description: The EUT's RF-signal is first attenuated before it is connected to the input of the RF-coupler. The direct output branch is connected to the spectrum – analyzer, the coupled branch to the communication tester. The specific attenuation is determined prior to the measurement within a set-up calibration. The value is taken into account by correcting the measurement readings on the spectrum-analyser either by a transducer factor (TDF) or an relative offset to reference level.

Schematic:



Testing method: According to ANSI 63.10-2013 for each individual test, see more details in each chapter.

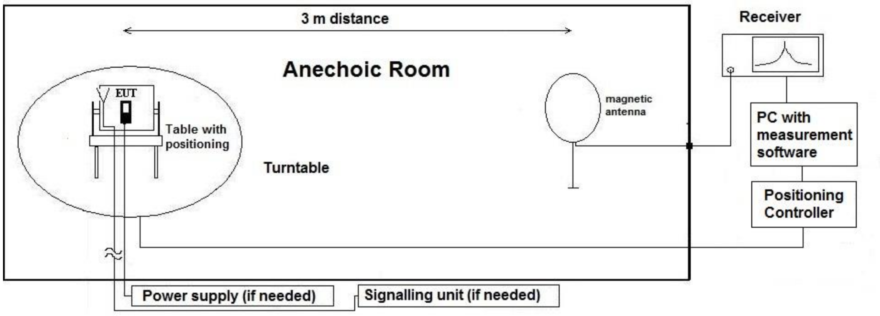
4.2. Test system set-up for radiated magnetic field measurements below 30 MHz

Specification: ANSI C63.4-2014 §5.3, §8.2.1, §8.3.1.1+§8.3.2.1 , ANSI C63.10-2013 chapter 6.4 (§6.4.4.2)

General Description: Evaluating the radiated field emissions are done first by an exploratory emission measurement and a final measurement for most critical frequencies determined.

The loop antenna was placed at 1 m height above ground plane and 3 m measurement distance from set-up for investigations. Because of reduced measurement distance, correction data were applied, as stated in chapter “General Limit - Radiated field strength emissions below 30 MHz“. The tests are performed in the semi anechoic room recognized by the regulatory commission.

Schematic:



Testing method:

Exploratory, preliminary measurement
The EUT and it’s associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (step 90°, range 0°to 360°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT), the emission spectrum was recorded. The loop antenna was moved at least to 2-perpendicular axes (antenna vector in direction of EUT and parallel to EUT) in order to maximize the emissions. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a data reduction table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Final measurement on critical frequencies
Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT’s worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position).

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

Formula:

$E_C = E_R + AF + C_L + D_F - G_A$

$M = L_T - E_C$

AF =Antenna factor
C_L = Cable loss
D_F= Distance correction factor
E_C = Electrical field – corrected value
E_R = Receiver reading
G_A= Gain of pre-amplifier (if used)
L_T = Limit
M = Margin

All units are dB-units, positive margin means value is below limit.

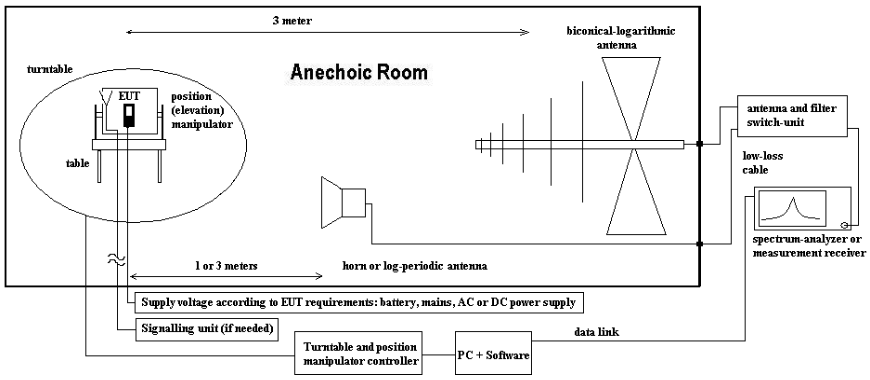
Distance correction: Reference for applied correction (extrapolating) factors due to reduced measurement distance:
ANSI C63.10:2013, §6.4.4.2 - Equations (2) + (3) + (4)

4.3. Test system set-up for radiated electric field measurement 30 MHz to 1 GHz

Specification: ANSI C63.4-2014 chapter 8.2.3, ANSI C63.10-2013 chapter 6.5

General Description: Evaluating the field emissions have to be done first by an exploratory emissions measurement and a final measurement for most critical frequencies. The tests are performed in a NSA-compliant semi anechoic room (SAR) recognized by the regulatory commissions.

Schematic:



Testing method:

Exploratory, preliminary measurements
The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (range 0° to 360°, step 90°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.

Measurement antenna: horizontal and vertical, heights: 1,0 m and 1,82 m as worst-case determined by an exploratory emission measurements. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Final measurement on critical frequencies
Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc. either on 10m OATS or 3m semi-anechoic room.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position). The measurement antenna height between 1 m and 4 m.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

Formula:

$E_C = E_R + AF + C_L + D_F - G_A$ (1)

$M = L_T - E_C$ (2)

AF = Antenna factor
C_L = Cable loss
D_F = Distance correction factor (if used)
E_C = Electrical field – corrected value
E_R = Receiver reading
G_A = Gain of pre-amplifier (if used)
L_T = Limit
M = Margin

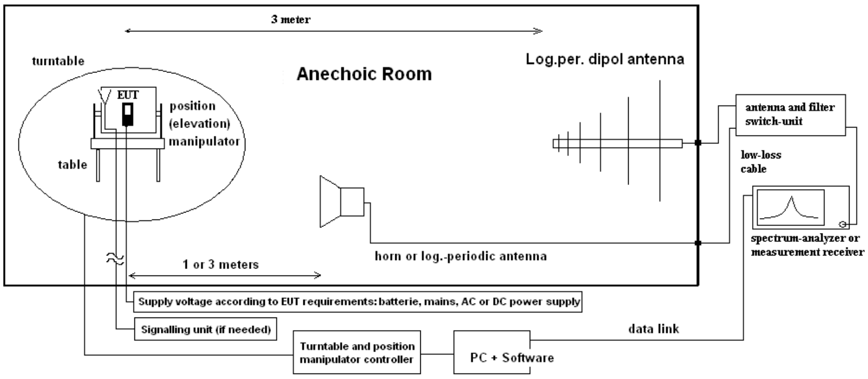
All units are dB-units, positive margin means value is below limit.

4.4. Test system set-up for radiated electric field measurement above 1 GHz

Specification: ANSI C63.4-2014 chapter 8.3, ANSI C63.10-2013 chapter 6.6.3.3 & 6.6.4

General Description: Evaluating the emissions have to be done first by an exploratory emissions measurement and a final measurement for most critical frequencies. The tests are performed in a CISPR 16-1-4:2010 compliant fully anechoic room (FAR) recognized by the regulatory commission. The measurement distance was set to 3 meter for frequencies up to 18 GHz and 2 meter above 18 GHz. A logarithmic periodic antenna is used for the frequency range 30 MHz to 1 GHz. Horn antennas are used for frequency range 1 GHz to 40 GHz. The EUT is aligned within 3 dB beam width of the measurement antenna with three orthogonal axis measurements on the EUT.

Schematic:



Testing method:

Exploratory, preliminary measurements
The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 1.55 m height which is placed on the turntable. By rotating the turntable (range 0° to 360°, step 15°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.
The measurements are performed in horizontal and vertical polarization of the measurement antennas. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Final measurement on critical frequencies
Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.
Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself over 3-orthogonal axis and the height for EUT with large dimensions.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.
On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

Formula:

$E_C = E_R + AF + C_L + D_F - G_A$ (1)

$M = L_T - E_C$ (2)

E_C = Electrical field – corrected value
E_R = Receiver reading
M = Margin
L_T = Limit
AF = Antenna factor
C_L = Cable loss
D_F = Distance correction factor (if used)
G_A = Gain of pre-amplifier (if used)

All units are dB-units, positive margin means value is below limit.

Supply voltage	☐ 230 V 50 Hz via public mains		☒ 24 V DC			

5.2.2. Requirements:

FCC	☒ 2.1049(h) ☒ FCC 2.202 for information
Remark	The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission When the occupied bandwidth limit is not stated in the applicable RSS or reference measurement method, the transmitted signal bandwidth shall be reported as the 99% emission bandwidth, as calculated or measured.

5.2.3. EUT settings

For FHSS-systems hopping mode was switched-off so fixed three different channels could be measured.
The EUT was instructed to send with maximum power (if adjustable) according applicants instructions.
Different modulation characteristics have been checked, e.g. data rates which EUT can operate.

5.2.4. Measurement method

The measurement was performed with the RBW set to 10kHz. The span was set to cover the complete carrier. Three carrier frequencies (low/middle/high) were used for showing the compliance with this requirement. A 99% OBW measurement function was used to measure the bandwidth compared 99% of the highest In-Band power. The operating modes have been varied (e.g. data rate, modulation scheme, etc.). The hopping-mode is switched off.

5.2.5. Spectrum-Analyzer Settings

Span	Set as to fully display the emissions and approximate 20dB below the PEAK level
Resolution Bandwidth (RBW)	Set to approx. 1% …3% of the emission width
Video Bandwidth (VBW)	3 times the resolution bandwidth
Sweep time	Coupled and low enough to have no gaps within power envelope
Detector	Sample (if bin width: Span/no. of frequency points SA < 0.5*RBW SA otherwise Peak detector)
Sweep mode	Repetitive Mode, Max hold

5.2.6. 99% Occupied Bandwidth Results:

5.3.2. Requirements:

FCC	☒ §15.247 (a) (1)
Remark	***(1)*** *Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.*

5.3.3. EUT settings

For FHSS-systems hopping mode was switched-off so fixed three different channels could be measured.
The EUT was instructed to send with maximum power (if adjustable) according applicants instructions.
Different modulation characteristics have been checked, e.g. data rates which EUT can operate.

5.3.4. Measurement method

The measurement was performed with the RBW set to 10kHz. The span was set to cover the complete carrier. Three carrier frequencies (low/middle/high) were used for showing the compliance with this requirement. A DELTA Marker method was set to measure the bandwidth compared to the highest In-Band power. The operating modes have been varied (e.g. data rate, modulation scheme, etc.). The hopping-mode is switched off.

5.3.5. Spectrum-Analyzer Settings

Span	Set as to fully display the emissions and approximate 20dB below the PEAK level
Resolution Bandwidth (RBW)	Set to approx. 1% …3% of the emission width
Video Bandwidth (VBW)	3 times the resolution bandwidth
Sweep time	Coupled and low enough to have no gaps within power envelope
Detector	Sample (if bin width: Span/no. of frequency points SA < 0.5*RBW SA otherwise Peak detector)
Sweep mode	Repetitive Mode, Max hold

5.3.6. Results:

Measurement value was recorded on CH 0, 39 and 78= 2441 MHz for worst case modulation type

DH5 packet type (GFSK-Modulation)

Set-up no.: 2 Op. mode: 1	**20 dB Bandwidth [MHz]**		
T_{Nom} = 21°C V_{Nom} = 3.7 V	Low channel = 0 (2402 MHz)	Middle channel =39 (2441 MHz)	High channel = 78 (2480 MHz)
Maximum Value	1.142858	1.142858	1.142858

Remark: see diagrams in separate annex 1

2DH5 Packet type (Pi/4-QPSK Modulation)

Set-up no.: 2 Op. mode: 1	**20 dB Bandwidth [MHz]**		
T_{Nom} = 21°C V_{Nom} = 3.7 V	Low channel = 0 (2402 MHz)	Middle channel =39 (2441 MHz)	High channel = 78 (2480 MHz)
Maximum Value	1.428572	1.415585	1.415585

Remark: see diagrams in separate annex 1

3DH5 packet type (8DPSK Modulation)

Set-up no.: 2 Op. mode: 1	**20 dB Bandwidth [MHz]**		
T_{Nom} = 21°C V_{Nom} = 3.7 V	Low channel = 0 (2402 MHz)	Middle channel =39 (2441 MHz)	High channel = 78 (2480 MHz)
Maximum Value	1.415585	1.415585	1.415585

Remark: see diagrams in separate annex 1

5.3.7. Verdict: pass

5.4. RF-Parameter - Channel Carrier Frequency Separation for FHSS-systems

5.4.1. Test location and equipment (for reference numbers please see chapter 'List of test equipment')

5.4.2. Requirements:

FCC	☒ §15.247 (a) (1)
Remark	Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudo randomly ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals..

5.4.3. EUT settings

For FHSS-systems hopping mode was switched-on so that adjacent Frequency Hopping channels could be measured. The EUT was instructed to send with maximum power (if adjustable) according applicants instructions. Different modulation characteristics have been checked, e.g. data rates which EUT can operate.

5.4.4. Measurement method

The measurement to prove this requirement was performed with a low RBW of 100kHz, peak detector and trace Hold-Max function in order to resolve each frequency carrier separately.
The span of the frequency analyzer was set to cover the carrier investigated as well as its neighbour channels.
A frequency DELTA Marker method was set to measure the frequency separation between the channels.

5.4.5. Measurement Results

Set-up no.: 2 Op. mode: 2	**Channel separation | Hopping ON**	
T_{Nom} = 21°C V_{Nom} = 3.7 V	Measured around middle channel (2441 MHz)	Channel Separation (MHz)
DH5	CH38/CH39/CH40	1.003 and 1.003
2DH5	CH38/CH39/CH40	1.003 and 1.000
3DH5	CH38/CH39/CH40	1.009 and 0.997
Applicants declared value	1 MHz according BT-core spec.	

Remark: see diagrams enclosed in annex 1 for different modulations

5.5. RF-Parameter – Number of Hopping Channels for FHSS-systems

5.5.1.Test location and equipment (for reference numbers please see chapter 'List of test equipment')

5.5.2. Requirements:

FCC	☒ §15.247 (a) (1) (iii)
Remark	Frequency hopping systems in the 2400-2483.5 MHz band shall use at least 15 channels. Transmissions on particular hopping frequencies may be avoided or suppressed provided that at least 15 hopping channels are used.

5.5.3. EUT settings

For FHSS-systems hopping mode was switched-on so that adjacent Frequency Hopping channels could be measured. The EUT was instructed to send with maximum power (if adjustable) according applicants instructions. Different modulation characteristics have been checked, e.g. data rates which EUT can operate.

5.5.4. Measurement method

The measurement to prove this requirement was performed with a low RBW of 100kHz, peak detector and trace Hold-Max function in order to resolve each frequency carrier separately.

The span of the frequency analyzer was set to cover the Hopping channels in two parts namely 2.4 GHz Lower spectrum and 2.4 GHz Upper spectrum. On extreme right & left channels Markers were set to indicate the corresponding channel frequency.

5.5.5. Number of Hopping Channels Results:

Number of Hopping Channels Measurements			
Temperature: +21 °C	**Voltage Supply 24 V DC**	**Setup: 2**	**Op. Mode: 2**
Modulation: GFSK		**Frequency Hopping ON**	
Data Rate		**Total Channels** **2.4 GHz Spectrum**	
[Kbps]		**[Number]**	
DH5		**79**	
Minimum Number of Hopping Channels Limits- FCC 15.247		**15**	
Remark 1: For further details please refer → Annex 1			

5.5.6. Minimum Number of Hopping Channels Verdict: Pass

5.6. RF-Parameter – Average Time of Occupancy for FHSS systems

5.6.1.Test location and equipment (for reference numbers please see chapter 'List of test equipment')

test location	☒ CETECOM Essen (Chapter. 2.2.1)		☐ 443 System CTC-FAR-EMI-		☐ Please see Chapter. 2.2.3	
test site	☐ 441 EMI SAR	☐ 487 SAR NSA	☐ 337 OATS	☒ 347 Radio.lab.	☐	☐

power supply	☐ 456 EA 3013A	☐ 457 EA 3013A	☐ 459 EA 2032-50	☐ 268 EA- 3050	☐ 494 AG6632A	☒ 354 NGPE 40
otherwise	☒ 530 10dB Attenuator		☒ cable K4	☐ Directional Coupler 1539R-10		
Supply voltage	☒ 24 V DC					

5.6.2. Requirements:

FCC	☒ §15.247 (a) (1) (iii)
Remark	The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

5.6.3. EUT settings

For FHSS-systems hopping mode was switched-on so that occupancy time of Frequency Hopping channels could be measured. The EUT was instructed to send with maximum power (if adjustable) according applicants instructions. Different modulation characteristics have been checked, e.g. data rates which EUT can operate.

5.6.4. Measurement method:

The measurement was performed with a spectrum analyzer set to ZERO span. The device was set to work within the defined specification with frequency Hopping Mode ON. The spectrum-analyzer was set the MAX-Hold positive peak detector mode. The sweep time set as long as necessary to capture the full signal burst per hopping channel. The burst on-period is captured by setting appropriate markers in the rising and falling edges.

5.6.5. Average occupancy time calculations:

Formula for calculating the dwell time (pseudo-hopping sequence over all channels assumed):

Average Dwell Time = $Timeslot\ length \cdot \frac{Hop\ rate}{number\ of\ hopping\ channels} \cdot time\ period$

The EUT employs Proprietary 2.4 GHz RF Transceiver Frequency Hopping system with total 79 channels. The maximum staying time of 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. = 0.4 seconds X 79 = 31.6 Seconds.

That means the average time of occupancy on any channel shall not be greater than 0.4 seconds within 31.6 seconds.

5.6.6. Average occupancy time Results:

Average Occupancy Time Measurements					
Temperature :+21 °C		Voltage Supply 24 V DC		Setup: 2	Op. Mode: 2
Modulation :			Frequency Hopping ON		
Data Rate	Channel	Single Transmission Time	Number of Transmissions in 31.6 Seconds	Average Occupancy Time in 31.6 Seconds	
[Kbps]	[Number]	[milliseconds]	[Number]	[milliseconds]	
DH5	39	0.41410	640	265.024	
2-DH5		1.6681	213	355.305	
3-DH5		2.9160	128	373.248	
Average Occupancy Time Limits- FCC 15.247				≤ 400 milliseconds	
For further details please refer → Annex 1:					

5.6.7. Average Occupancy Time Verdict: Pass

5.7. RF-Parameter – Out-of-Band 20 dBc Conducted Emissions for FHSS systems

5.7.1.Test location and equipment (for reference numbers please see chapter 'List of test equipment')

test location	☒ CETECOM Essen (Chapter. 2.2.1)		☐ 443 System CTC-FAR-EMI-		☐ Please see Chapter. 2.2.3

otherwise	☒ 530 10dB Attenuator		☒ RTK161	☐ Directional Coupler 1539R-10		
Supply voltage	☒ 24 V DC					

5.7.2. Requirements:

FCC	☒ §15.247 (d)
Remark	In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating. the RF power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. based on either an RF conducted or a radiated measurement. provided that the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of root-mean-square averaging over a time interval. as permitted under FCC15.247 paragraph (b)(3) / RSS-247section 5.4(d). the attenuation required shall be 30 dB instead of 20 dB

5.7.3. EUT settings

Fixed Channel Mode:
For FHSS-systems Hopping mode was switched-off so fixed three different channels could be measured.
The EUT was instructed to send with maximum power (if adjustable) according applicants instructions.
Different modulation characteristics have been checked. e.g. data rates which EUT can operate.

Hopping Mode:
For FHSS-systems Hopping mode was switched- ON so emissions from hopping channels could be measured. The EUT was instructed to send with maximum power (if adjustable) according applicants instructions. Different modulation characteristics have been checked. e.g. data rates which EUT can operate.

5.7.4. Measurement Method:

The measurements were performed with the RBW set to 100kHz & maximum carrier level was indicated with MAX-Hold positive peak detector using markers. Then a frequency line was set 20 dB below this measured maximum carrier level.

Then using RBW 100 kHz & spectrum analyzer span from 150 kHz to 25 GHz in three steps spurious emissions were measured with MAX-Hold positive peak detector.

The sweep time set as long as necessary to capture the full signal burst per hopping channel. The burst on-period is captured by setting appropriate markers in the rising and falling edges.

5.7.5. Results: Hopping mode off

Set-up no.: 2 Op-Mode: 1	**RF-Conducted test: 20 dBc spurious emissions**					
Frequency Range	**Modulation 8-DPSK** Low channel =0 (2402 MHz) Level Reference (In-Band) = 2.02 dBm Limit = -17.98 dBm		**Modulation Pi/4-QPSK** Middle channel = 39 (2441 MHz) Level Reference (In-Band) = 1.90 dBm Limit= -18.1 dBm		**Modulation GFSK** High channel = 78 (2480 MHz) Level Reference (In-Band)= 0.03 dBm Limit= -19.97 dBm	
	Frequency [MHz]	Value [dBc]	Frequency [MHz]	Value [dBc]	Frequency [MHz]	Value [dBc]
150kHz to 30 MHz	0.129326	> 40	1.788765	> 40	1.266390	> 40

General measurement procedures		Please see chapter "Test system set-up for radiated electric field measurements above 1 GHz" for general measurements procedures in anechoic chamber.		

5.11.4. Measurement Method

For uncritical results where a measurement resolution bandwidth of 1MHz can clearly show the compliance without influencing the results. a field strength measurement was performed to show compliance.

For critical results a Marker-Delta marker method was used for showing compliance to restricted bands. The method is according ANSI C63.10:2013. Chapter 6.10.6 "Marker-Delta method".. The method consists of three independent steps:

1. Step: Prior to the measurement the fundamental radiated In-Band field strength was performed. The determined value is used as reference value.

2. Step: Second step consist of finding the relative attenuation between the fundamental emission and the maximum local out-of-band emission (within 2 MHz range around the band edge either on the band-edge directly or some modulation product if the level is greater than that on the band-edge) when measured with lower resolution bandwidth.

3. Step: The delta value recorded in step 2 will be subtracted from value recorded in step 1. thus giving the required field strength at the band-edge. This value must fulfil the requirements for radiated spurious emissions in restricted bands in FCC §15.205 with the general limits of FCC §15.209.

5.11.5. EUT settings

The EUT was set in Hopping OFF mode with maximum power (if adjustable) according to applicants instructions.

5.11.6. Results: for non-restricted bands near-by
5.11.6.1. Non-restricted bands near-by - limits according FCC §15.247

5.12. Measurement uncertainties

The reported uncertainties are calculated based on the standard uncertainty multiplied with the appropriate coverage factor **k**, such that a confidence level of approximately 95% is achieved.
For uncertainty determination, each component used in the concrete measurement set-up was taken in account and it's contribution to the overall uncertainty according it's statistical distribution calculated.

Following table shows expectable uncertainties for each measurement type performed.

RF-Measurement	Reference	Frequency range	Calculated uncertainty based on a confidence level of 95%						Remarks
Conducted emissions (U_{CISPR})	CISPR 16-2-1	9 kHz - 150 kHz 150 kHz - 30 MHz	4.0 dB 3.6 dB						-
Radiated emissions Enclosure	CISPR 16-2-3	30 MHz - 1 GHz 1 GHz - 18 GHz	4.2 dB 5.1 dB						E-Field
Disturbance power	CISPR 16-2-2	30 MHz - 300 MHz	-						-

Note / remarks		**Calibrated during system calibration:**
	1a	System CTC-SAR-EMS (Ref.-No. 442)
	1b	System-CTC-EMS-Conducted (Ref.-No. 335)
	1c	System CTC-FAR-EMI-RSE (Ref.-No . 443)
	1d	System CTC-SAR-EMI (Ref.-No . 441)
	1e	System CTC-OATS (EMI radiated) (Ref.-No. 337)
	1 f	System CTC-CTIA-OTA (Ref.-No . 420)
	1 g	System CTC-FAR-EMS (Ref.-No . 444)
	2	Calibration or equipment check immediately before measurement
	3	Regulatory maintained equipment for functional check or support purpose
	4	Ancillary equipment without calibration e.g. mechanical equipment or monitoring equipment
	5	Test System

Interval of calibration	12 M	12 month
	24 M	24 month
	36 M	36 month
	24/12 M	Calibration every 24 months, between this every 12 months internal validation
	36/12 M	Calibration every 36 months, between this every 12 months internal validation
	Pre-m	Check before starting the measurement
	-	Without calibration

9. Versions of test reports (change history)

Version	Applied changes	Date of release
--	Initial release	2018-10-24
C1	FCC ID corrected	2018-11-12
