

# Description

The wireless remote control device contains a wireless transmitters and wireless receivers.

Wireless transmitter control motors and lights. There's a long line inside , and all the remote commands are sent out through the external case button, modulate and code by the internal circuit, then sent the electromagnetic waves out through antenna by the high-frequency signal amplifier.

Wireless receiver is installed in the base for receiving the wireless signals, it processes the transmitter signal from the emitter like enlarging, shaping, decoding, and transform the received signals into pulse signals which the executive circuit can be recognized.
