

## **SAR evaluation considerations for handsets with multiple transmitters and antennas**

### **Procedure:**

FCC KDB 648474 v01r05 SAR evaluation considerations for handsets with multiple transmitters and antennas.

Table 1 – Output Power Thresholds for Unlicensed Transmitters

	2.45	5.15 - 5.35	5.47 - 5.85	GHz
P <sub>Ref</sub>	12	6	5	mW
Device output power should be rounded to the nearest mW to compare with values specified in this table.				

Table 2 – Summary of SAR Evaluation Requirements for a Cell Phone with Multiple Transmitters

	Individual Transmitter	Simultaneous Transmission
Licensed Transmitters	<u>Routine evaluation required</u>	<u>SAR not required:</u> <u>Unlicensed only</u> <ul style="list-style-type: none"><li>○ when stand-alone 1-g SAR is not required and antenna is <math>\geq 5</math> cm from other antennas</li></ul> <u>Licensed &amp; Unlicensed</u> <ul style="list-style-type: none"><li>○ when the sum of the 1-g SAR is <math>&lt; 1.6</math> W/kg for all simultaneous transmitting antennas</li><li>○ when SAR to peak location separation ratio of simultaneous transmitting antenna pair is <math>&lt; 0.3</math></li></ul> <u>SAR required:</u> <u>Licensed &amp; Unlicensed</u> <p>antenna pairs with SAR to peak location separation ratio <math>\geq 0.3</math>; test is only required for the configuration that results in the highest SAR in stand-alone configuration for each wireless mode and exposure condition</p> <p><b>Note:</b> simultaneous transmission exposure conditions for head and body can be different for different style phones; therefore, different test requirements may apply</p>
Unlicensed Transmitters	<p>When there is no simultaneous transmission –</p> <ul style="list-style-type: none"><li>○ output <math>\leq 60/f</math>: SAR not required</li><li>○ output <math>&gt; 60/f</math>: stand-alone SAR required</li></ul> <p>When there is simultaneous transmission –</p> <p><u>Stand-alone SAR not required when</u></p> <ul style="list-style-type: none"><li>○ output <math>\leq 2 \cdot P_{Ref}</math> and antenna is <math>\geq 5.0</math> cm from other antennas</li><li>○ output <math>\leq P_{Ref}</math> and antenna is <math>\geq 2.5</math> cm from other antennas</li><li>○ output <math>\leq P_{Ref}</math> and antenna is <math>&lt; 2.5</math> cm from other antennas, each with either output power <math>\leq P_{Ref}</math> or 1-g SAR <math>&lt; 1.2</math> W/kg</li></ul> <p><u>Otherwise stand-alone SAR is required</u></p> <p><u>When stand-alone SAR is required</u></p> <ul style="list-style-type: none"><li>○ test SAR on highest output channel for each wireless mode and exposure condition</li><li>○ if SAR for highest output channel is <math>&gt; 50\%</math> of SAR limit, evaluate all channels according to normal procedures</li></ul>	
Jaw, Mouth and Nose	<p><u>Flat phantom SAR required</u></p> <ul style="list-style-type: none"><li>○ when measurement is required in tight regions of SAM and it is not feasible or the results can be questionable due to probe tilt, calibration, positioning and orientation issues</li><li>○ position rectangular and clam-shell phones according to flat phantom procedures and conduct SAR measurements for these specific locations</li></ul>	When simultaneous transmission SAR testing is required, contact the FCC Laboratory for interim guidance.

### **Equipment:**

A mobile phone contains GSM850/1900 transmitter and Bluetooth transmitter with FCC ID YROG151I.

### **Measurement data:**

The closest distance between the GSM850/1900 antenna and Bluetooth antenna is **33mm**.

The maximum output power of Bluetooth transmitter is **0.971 mW**.

The maximum SAR value for GSM850/1900 transmitter is **0.878 W/kg (1-g)**.

### **Conclusion:**

Based on the output power of Bluetooth transmitter, antenna separation and the SAR value of GSM850/1900 transmitter, stand-alone Bluetooth SAR evaluation is not required.

The sum of 1-g SAR is **0.878 W/kg + 0 W/kg = 0.878 W/kg**, which is less than 1.6 W/kg. Therefore, simultaneous transmission SAR evaluation is not required.
