## Letter of Attestation

March 4, 2013

To Whom It May Concern:

We, Texas Instruments Incorporated, hereby declare that our evaluation modules TRF7960ATB and TRF7970ATB are electrically similar with regards to power out and supported modulations. The TRF79xxATB bare board used for both modules is electrically identical. The only difference between the model numbers is the transceiver IC itself, with the analog front end module used inside those ICs being identical. Therefore, it can be considered that the TRF7960ATB and the TRF7970ATB are, for regulatory compliance purposes, the same with regards to Title 47, Part 15 regulations for intentional radiators operating at 13.56MHz.

As of March 4, 2013, (date of this communication) the TRF7960ATB and the TRF7970ATB are identical - in all aspects including bill of materials (with the exception of the IC, as described above), stated ratings, and printed wiring board - to the TRF7960ATB tested at Nemko in September of 2011 as referenced in Nemko NEX #181937.
